

Figure 6: Completing the configuration of the 'animate' tab

to add colours to your drawing, then double click the specific element and go to *Properties*. It will have a fill style option. In the 'fill colour' tab, we can change the colours used for filling the closed figure elements. In the 'stroke style' tab, the colour, width and other properties of the drawing pencil can be modified. The 'elements' tab takes care of properties like ID, default style, tag and path. Any shape can be created easily using the SVG editor. Any number of shapes and lines (all sizes) can be used to create the drawing we require. In this case, a car is created with 24 lines and 2 circles, with colours filled in the wheels, as shown in Figure 5.

After drawing the car, save and close the editor. Then select the 'events' tab in the SVG graphics node, and add a new element. The selector is given a name (car) and 'click' is the

action for stimulation. The messages 'car has started' and '#car' are given in the *msg.payload* and *msg.topic* options, respectively.

Once the event tab of the SVG graphics node is configured, select the JS tab. The selector ID is given as 'car' and 'click' is given as the action

for stimulation.

After configuring the event and JS tabs in the SVG editor, select the 'animate' tab and add a new element. Both the animation and target element IDs are specified as 'car', as shown in Figure 6. Change the attribute to 'transform' and the property to 'Skew
