

```
// * The function should return true if the connection should be accepted, false otherwise
// *
// * Alternatively, if this function is defined to accept a second argument, callback,
// * it can be used to verify the client asynchronously.
// * The callback takes three arguments:
// *   - result : boolean, whether to accept the connection or not
// *   - code : if result is false, the HTTP error status to return
// *   - reason: if result is false, the HTTP reason string to return
// */
// },
}

adminAuth: {
  type: "credentials",
  users: [{
    username: "admin",
    password: "$2b$08$NIJKvK2JFfV4lKau2u54f.80BnHewV73C4Py4mnPhNTy4l$skScguc",
    permissions: ""
  }],
},
```

Figure 6: Setting a password

Figure 7: Final look after setting up the password

The final step is to provide at least some basic security to our machine, for which we need to run the following command:

node-red-admin hash-pw

This generates a hash value that you need to copy and keep.

Enter the following command to add the script, and then enter your password:

```
nano ~/.node-red/settings.js
```

Next, add the script shown in Figure 6 to secure your system. In this script, replace ‘passwd’ by the hash value. Our installation is now complete. If we go to our local host, it will ask for a password. Once the password is entered, we can use the tool normally as per our needs, as shown in Figure 7.

If you have liked this short tutorial, do try it out to connect your hardware devices. **END**
