

improves performance by up to 20 per cent, while the update of the file system to OpenZFS 2.1 reduces system restart and failover times by more than 80 per cent for multi-petabyte systems.

SOOS joins the DigitalOcean Marketplace

SOOS has been chosen by DigitalOcean to be included in a new suite of SaaS add-ons available to developers through the DigitalOcean Marketplace. It has been selected as one of just twelve suppliers to join the DigitalOcean Marketplace.

Developers on the DigitalOcean cloud may now use SOOS to scan for vulnerabilities and licence issues, produce SBOMs, manage dependencies, and run SOOS's no

limit vulnerability scanner against Web apps and APIs.

With the tools developers need to identify and address open source vulnerabilities, SOOS makes it simple to include software security early in the software development life cycle, making software safer for everyone

"We are excited to join the DigitalOcean Marketplace and connect with their global community of developers," said Eric Allard, SOOS's CTO. "This is a great opportunity to broaden our impact. Making our easy-to-set-up and affordable tools accessible through DigitalOcean's Marketplace furthers our mission to make software safer for everyone."

Alibaba open sources code of its federated learning platform

The open source community now has access to the source code of Alibaba DAMO Academy's latest federated learning platform FederatedScope, a complete platform with easy-to-use packages. With machine learning and artificial intelligence on the increase, acquiring training data to construct AI models is becoming more of a focus, as the process may raise privacy concerns.

Federated learning, a method of privacy-preserving computation, has arisen to meet this difficulty. To relieve privacy concerns, intermediate training results – rather than raw user data – are supplied back to the cloud server by

hope to promote the research and industrial deployment of privacy-preserving computation in different sectors, such as healthcare and smart mobility that usually involves sensitive user data and requires strict privacy protection practices," said Bolin Ding, research scientist at Alibaba DAMO Academy.

coordinating the training of micro-tasks across several end devices.

"By sharing our self-developed federated learning technologies with the open source community, we

NVIDIA launches open source GPU kernel modules

NVIDIA has launched open source GPU kernel modules.

This is a huge step in bettering the experience of using NVIDIA GPUs in Linux, allowing for closer integration with the OS and easier debugging, integration, and contribution from developers. The open source modules are easier for Linux distribution providers to use. They also sign and distribute the NVIDIA GPU driver to improve the out-of-the-box user experience. Canonical and SUSE can bundle open kernel modules for Ubuntu and SUSE Linux Enterprise distributions right away.

For faster root cause debugging, developers can trace into code pathways and understand how kernel event scheduling interacts with their workload. Furthermore, enterprise software developers can now simply integrate the driver into their project's customised Linux kernel.

With input and reviews from the Linux end-user community, the NVIDIA GPU driver quality and security will be improved even more. NVIDIA releases a snapshot of the source code on GitHub with each new driver release. Patches supplied by the community are assessed and, if approved, are included in a future driver release.
