platforms and operating systems, as they need to get familiar with all of them.

What does HarmonyOS do?

HarmonyOS creates a resource pool (as shown in Figure 1) across all the devices, and using the distributed virtual bus it tries to connect them all. It helps application developers to combine these devices into a single super device. It allows the applications to use the resources from all the devices that are available, which is very useful for the end customer.

Developed and backed by Huawei Technologies, HarmonyOS follows

the 1 + 8 + N strategy (Figure 2).

Here '1' focuses on devices such as smartphones; '8' covers most of the devices such as eyewear, tablets, PCs, watches, speakers, vehicle terminals, earphones, TVs, etc; and 'N' represents all the available IoT devices.

The applications HarmonyOS makes possible

With the Harmony architecture you do not have to install any other application on your mobile in order to operate other devices. That is done automatically by the HarmonyOS Atomic Service. This one feature makes a number of use cases possible.

Fitness and health: You can use your mobile phone for cross-device resource convergence. Devices like fitness bands, phones, weight trackers and treadmills can be collaborated into one super device with a simple integration of virtualisation, which uses HarmonyOS as its backbone. This super device can collect information from all these devices and give its feedback and suggestions.

Smart home: With HarmonyOS, home appliances can easily be operated with just the touch of a button. You can preheat your oven and choose the right configurations to prepare a particular dish. You can receive notifications on your device that tell you when you should be changing the filter of your air purifier and when the service is due. It can also help you get an appointment for the same. It is important to note that these applications do not come pre-installed. Depending on the services you need and the type of device you have, the corresponding user interface is provided. The experience remains the same across all devices.

Entertainment: You can stream the desired entertainment content on to bigger screens, use smart speakers, and integrate a microphone – a great collaborative experience. You can control all of this with a single device.
