

Microsoft joins the Open 3D Foundation

Microsoft has joined the Open 3D Foundation (O3DF) as a Premier member. The other members include Adobe, AWS, Huawei, Intel, and Niantic. Microsoft's involvement will add a lot of knowledge and thought leadership to the project, demonstrating how crucial it is for the industry to work together to create a high-fidelity, fully-featured open source 3D engine that is free of commercial conditions. Paul Oliver, Microsoft's principal group program manager, will join the O3DF governing board. The Foundation's strategic stewardship of 3D visualisation and simulation initiatives is guided by the governing board's innovative interactions with stakeholders. "Microsoft's roots in creativity run deep and we want to help creators wherever they are, whoever they are, and whatever platform they're creating for," said Oliver. "Having the Linux Foundation create the Open 3D Foundation is a fantastic step towards helping more creators everywhere, and we are excited to be a part of it."

Microsoft's continuous commitment to democratising game production and making its tools and technology available to game creators all over the world is reflected in this step. The company released its Game Development Kit to all developers via GitHub last year. Microsoft is extending its commitment to open up technology to everyone with its new partnership with O3DF.

Perforce acquires Puppet

Perforce Software has announced the acquisition of Puppet, a DevOps pioneer. The deal's financial parameters are not being made public. Puppet was founded in 2009 and has raised US\$ 189.5 million in investment to expand its DevOps infrastructure automation capabilities over the last decade. The startup was a pioneer in the DevOps arena, helping to evolve some of the field's core concepts. Ansible, which Red Hat bought for US\$ 150 million in 2015, and Chef, which Progress Software bought for US\$ 220 million in 2020, are often compared to Puppet and its technology.

Puppet will be run as a business unit within Perforce, supplying Puppet-branded infrastructure automation technology alongside other DevOps business units.

Kubernetes poses security concerns in the software supply chain

Kubernetes and cloud native computing are at the epicentre of a tectonic shift in the last decade towards enterprise use of open source software. In the 2022 edition of Synopsys' annual 'Open Source Security and Risk Analysis' report, four of the 17 industry sectors use open source in 100 per cent of their codebases; the remaining 13 industries use open source in 93 per cent to 99 per cent of their codebases.

The Kubernetes ecosystem includes a slew of additional open source components, including small, single-developer projects whose upkeep – or lack thereof – can put the platform at risk.

According to the 2022 'Cloud Native Threat Report' issued this April by container runtime security provider Aqua, attackers targeted Kubernetes 10 per cent more frequently in 2021 than the previous year, but this paled in comparison to the 300 per cent increase in software supply chain attacks. Because the Kubernetes platform is so widely used among organisations connected via cloud APIs, when attackers discover vulnerabilities that might be used to breach it, it can have far-reaching consequences.

As a result, early in the development process, Kubernetes security policies must cover raw code and base container images, a procedure known as 'shifting left'.
