

List of nodes

The nodes that we are going to use are listed below:

CSV reader node	 Node 1
Partitioning node	 Node 2
K-means node	 Node 3
Colour manager node	 Node 4
Shape manager node	 Node 5
Scatter plot node	 Node 6
Cluster assigner node	 Node 7

How to design the Corona virus cluster

- In the KNIME Analytics Platform, create a new workflow.
- Drag and drop the following nodes and connect, configure and execute them into the KNIME Workbench Editor:
 - CSV file which will automatically create a CSV reader node and connect the CSV reader to the partitioning node.
 - Connect the first partition of the partitioning node to the k-means node, and then connect its output lead to the colour manager, shape manager, and scatter plot node.
 - Connect the second partition of the partitioning node to the cluster assigner node and scatter plot node successively.

In Figure 1 we can see the Covid19 k-means clustering KNIME workflow.

Node configurations

Let us now configure the different nodes.

CSV reader

Figure 2 shows the configuration of the CSV reader node.
