

Mastodon, the open source alternative to Twitter, is getting popular

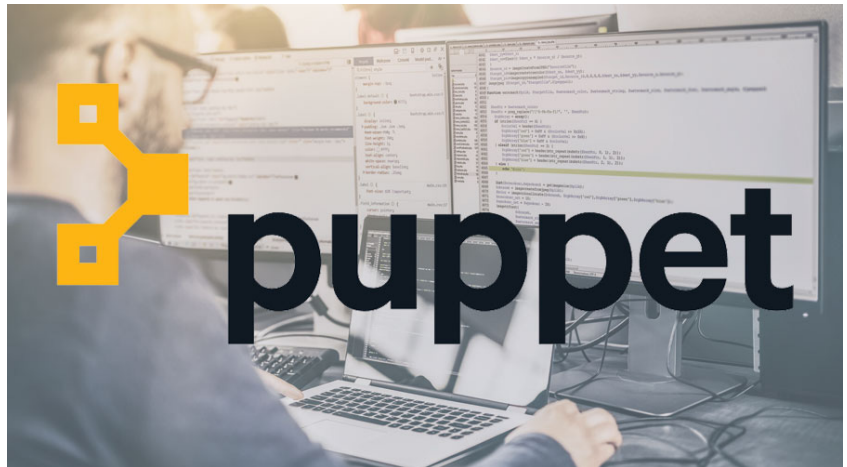

One Twitter alternative is thriving as a result of the news of Elon Musk making a bid for Twitter. According to Mastodon's founder, the open source social media platform that describes itself as the "biggest decentralised social network on the Internet" has been "exploding" since Musk's takeover bid. As per data from analytics firm Sensor Tower, Mastodon's official iOS and Android apps are also witnessing an increase in usage.

This isn't the first time Mastodon has benefited from Twitter's problems. Following controversy over Twitter's decision to remove user handles from the character restriction for @-replies, the startup gained popularity for a brief while in 2017. Mastodon had another surge in popularity in 2019, after users in India were enraged by moderation practices.

Mastodon, unlike Twitter, is not a single, centralised service. Though the interface resembles Twitter, it is based on an open source protocol. Users can form and maintain their own "instances," each with its own set of rules for membership, moderation, and other critical policies. Users can also take their followers with them from one instance to the next.

"Puppet pioneered what is now known as infrastructure as code and spearheaded effective practices for DevOps that flourish today," said Perforce CEO Mark Ties.

Ties explained that Puppet currently automates several aspects of the infrastructure management life cycle, including provisioning, patching, configuration, and maintenance of operating system and application components in data centre and cloud infrastructures. In the future, he expects Puppet will continue to innovate and provide services to aid DevOps teams as part of Perforce.

ARMO raises US\$ 30 million for Kubescape

Tel Aviv based ARMO, the company behind the Kubernetes open source security project Kubescape, said that this end-to-end open source Kubernetes security platform will receive US\$ 30 million in investment. The Series A investment, headed by Tiger Global alongside Hyperwise Ventures and participation from current investors

Pitango First and Peled Ventures, will ensure that the whole Kubernetes community has access to an open, transparent, and fully customisable security solution.

Kubescape as a cloud SaaS has swiftly grown in popularity, becoming one of the fastest-growing open source Kubernetes security tools, with tens of thousands of users and over 2500 registered customers. ARMO said that it is dedicated to creating and maintaining a Kubernetes security platform that is 100 per cent open source from start to finish.

Kubescape searches configuration files (i.e., YAML and Helm), Kubernetes clusters, and worker nodes for misconfigurations and known vulnerabilities, computing risk scores and trends. The connectivity of roles and privileges between different components of a Kubernetes cluster is visualised using a robust role based access control (RBAC) module. Kubescape already provides all of these features, acting as a 'single pane of glass' for an organisation's Kubernetes security.

LineageOS 19 is now available

LineageOS is an Android based operating system that may be used to replace the software that comes pre-installed on a variety of compatible smartphones,
