

```
vars: function
  super: <ggproto object: Class FacetNull, Facet, gg>
-----
geom_point: na.rm = FALSE
stat_identity: na.rm = FALSE
position_identity
```

Line chart

We can generate a line chart by specifying the *geom* attribute as 'line', as shown below:

```
> qplot(x=x, y=y, data=d, xlab="Year", ylab="Inflation",
  main="Inflation, consumer prices (annual %)", geom="line")
```

The corresponding line graph is shown in Figure 6.

The 'Bank Marketing Data Set' for a Portuguese banking institution is available from the UCI machine learning repository available at <https://archive.ics.uci.edu/ml/datasets/Bank+Marketing>. The data can be used for public research use.

There are four data sets available, and we will use the *read.csv()* function to import the data from a 'bank.csv' file into a data frame.

```
> bank <- read.csv(file="bank.csv", sep=";")

> bank[1:3,]
  age      job marital education default balance housing
1  30 unemployed married   primary      no   1787      no
  loan contact day
no cellular  19
2  33  services married secondary      no   4789      yes
yes cellular  11
3  35 management single  tertiary      no   1350      yes
no cellular  16
  month duration campaign pdays previous poutcome y
1  oct         79         1    -1         0 unknown no
2  may        220         1   339         4 failure no
3  apr        185         1   330         1 failure no
```
