

Samsung introduces software solution for CXL memory platform

Samsung Electronics has introduced an open source software solution, the Scalable Memory Development Kit (SMDK), designed to support the Compute Express Link (CXL) memory platform.

Earlier in May, Samsung had unveiled the CXL memory expander that allows memory capacity and bandwidth to scale to levels far exceeding what is possible in today's server systems. Now, the company's CXL platform is being extended beyond hardware to offer easy-to-integrate software tools, making CXL memory much more accessible to data centre system developers for emerging artificial intelligence (AI), machine learning (ML) and 5G-edge markets.

The CXL interconnect is an open, industry-backed standard that enables different types of devices such as accelerators, memory expanders and smart I/O devices to work more efficiently when processing high-performance computational workloads.

"In order for data centre and enterprise systems to smoothly run next-generation memory solutions like CXL, development of corresponding software is a necessity," said Cheolmin Park, vice president of the memory product planning team at Samsung Electronics.

Samsung said its SMDK enables the main memory and the CXL memory expander to work together seamlessly in heterogeneous memory systems. The SMDK is now available on a limited basis for initial testing and optimisation, and will be open sourced within the first half of next year.

Linux Foundation raises US\$ 10 million to support OpenSSF

The Linux Foundation has raised US\$ 10 million in new investments to expand and support the Open Source Security Foundation (OpenSSF), a cross-industry collaboration that brings together multiple open source software initiatives under one umbrella to identify and fix cybersecurity vulnerabilities in open source

software and develop improved tooling, training, research, best practices and vulnerability disclosure practices. Open source luminary Brian Behlendorf will serve the OpenSSF community as general manager.

Financial commitments from premier members include Amazon, Cisco, Dell Technologies, Ericsson, Facebook, Fidelity, GitHub, Google, IBM, Intel, JPMorgan Chase, Microsoft, Morgan Stanley, Oracle, Red Hat, Snyk and VMware. Additional commitments come from general members Aiven, Anchore, Apiiro, AuriStor, Codethink, Cybertrust Japan, Deepfence, Devgistics, DTCC, GitLab, Goldman Sachs, JFrog, Nutanix, StackHawk, Tencent, TideLift and Wind River.

"This pan-industry commitment is answering the call from the White House to raise the baseline for our collective cybersecurity wellbeing, as well as 'paying it forward' to open source communities to help them create secure software from which we all benefit," said Jim Zemlin, executive director at the Linux Foundation.

According to industry reports ('2021 State of the Software Supply Chain', by Sonatype), software supply chain attacks have increased 650 per cent and are having a severe impact on business operations.

Rafay Systems to open source its zero-trust access and GitOps services

Rafay Systems, a platform provider for Kubernetes operations, has announced its plans to open source its zero-trust access and GitOps services.

Developers will be able to take advantage of, and contribute to, these battle-tested services that significantly reduce the complexities associated with securing access to and automating the ongoing operations of Kubernetes infrastructure and modern applications. The company said that these two services are the first of many that Rafay intends to open source over time.

As Kubernetes has become a priority for enterprises, access to modern infrastructure and configuration management has proven to be a major challenge, particularly when leveraging multiple clouds or operating multiple virtual private clouds (VPCs) in the same cloud environment. Enterprises are also finding it difficult to enforce repeatable workflows for managing the ongoing operations of Kubernetes infrastructure and modern applications.

With the zero-trust access and GitOps services available as open source projects, developers can address the multi-tenant access and automation requirements that these services were built to address. Developers can also collaborate with project contributors to further advance on-premises, hybrid, multi-cloud and edge use cases.

Haseeb Budhani, CEO of Rafay Systems, said, "By open sourcing zero-trust access and GitOps services, we are doing our part in furthering the community's goals of making cloud-native computing ubiquitous. We look forward to the community embracing these projects, and are eager to engage with developers and DevOps professionals who are open to partnering with the current cadre of contributors focused on accelerating Kubernetes adoption in enterprises."
