

Broadband Forum launches 'OB-5WWC'

A new Broadband Forum project, Open Broadband – WWC Reference Implementation for 5G-RG (OB-5WWC), has been launched for vendors and operators to bring products to market in a shorter timeframe. The open source project is said to bring the full benefits of the 5G ecosystem to fixed-line services and offer a full end-to-end solution to operators.

“The formation of the OB-5WWC project will help to fulfil the need for 5G and fixed-line convergence that is now viewed as a fundamental need, and will ensure that the full benefits of the 5G ecosystem can be realised,” said Broadband Forum OB-5WWC project leader David Woolley. “We have already received strong support from the service provider community and are calling for all interested parties across the industry, including customer premises equipment (CPE) manufacturers, end-to-end integrators, and hardware and software vendors, to join the project and share ideas.”

OB-5WWC aims to create a reference implementation of the Broadband Forum specified Wireless Wireline Convergence solution for 5G capable residential gateways (5G-RGs), and builds on the important Broadband Forum and 3GPP specifications already available. The founding members are BT, Deutsche Telekom, Telecom Italia, Telstra, Verizon and Vodafone UK.

OB-5WWC seeks to provide a production grade 5G solution stack capable of integration with OpenWRT/RDK-B frameworks, and aims to provide a reference for testing access gateway function (AGF) and RG test tool development.

This release comes at a time when the OpenStack project is deployed in production more widely than ever. Over 100 new OpenStack clouds have been built in the past 18 months, growing the total number of cores under OpenStack management to more than 25,000,000. Organisations with deployments ranging from hundreds of cores to six million cores have logged significant growth, according to the 2021 OpenStack User Survey.

Xena includes enhancements to features and integrations for open source applications on which the OpenStack clouds function.

OpsCruise announces 'free forever' plan to support use of open source telemetry

OpsCruise, the cloud application observability company, has announced a new ‘free forever’ plan to support further adoption and use of popular open source telemetry such as Kubernetes, eBPF, Prometheus, Loki, Jaeger and Istio.

Cloud native enterprises are often caught between two less than ideal choices: pick and choose amongst a multitude of free, open source tools but where a heavy lift is required around deployment, configuration, training and maintenance later, OR choose a commercial cloud based solution that’s easier but is expensive and locks you into a proprietary architecture.

OpsCruise said it offers the best by supporting and embedding popular open source monitoring tools into a smart-layer that auto-discovers and maintains all dependencies, predicts performance degradations, troubleshoots in context and automates causal analysis and more.

Julius Volz, ex-Google and the creator of one of the most popular open source monitoring tools, Prometheus, noted, “OpsCruise is a promising and novel approach for integrating information from both Prometheus and Kubernetes to help visualise the environment and automate production troubleshooting.”

Perforce announces OpenLogic Download Hub for Enterprise Linux

Perforce Software, a provider of solutions to enterprise teams, has announced its new OpenLogic Download Hub for Enterprise Linux.

The Download Hub — which gives users on-demand access to updates and patches that address critical security vulnerabilities within CentOS 6, 7, and 8 — bolsters OpenLogic’s popular Enterprise Linux Support offering.

Tim Russell, chief product officer at Perforce Software, said, “The new Enterprise Linux Download Hub is a prime example of our work in continuously improving this offering, and helping our customers to reduce downtime and improve security.”

This announcement comes on the heels of major shifts within the Enterprise Linux landscape, including an abbreviated CentOS 8 life cycle and a discontinuation of CentOS Linux in favour of the rolling-release CentOS Stream.

“Organisations that went through major efforts to update their environments from versions 6 and 7 to CentOS 8 are now challenged to migrate to another Linux distribution,” said Javier Perez, OSS chief evangelist at Perforce Software. “For those who need additional time to plan these migrations, OpenLogic Technical Support for Enterprise Linux, and the accompanying Download Hub, extends the enterprise viability of these distributions by 5 years — and gives impacted enterprises some much needed peace of mind.”
