

is the differentiating factor. If your data is distributed, how are you going to get it faster to your customers at their fingertips? This is where Redis's enterprise-grade capabilities come to play and enable us to win.

Q. Do you focus on cloud developers, making Redis a preferable option for cloud applications, and not critical for on-premise use?

A. The fastest growing developer community is cloud developers. That is where the opportunity is at, and we would love to get more of them. But the reality is that we have cloud, on-premises, and open source developers who already use or want to use Redis. The demand we are seeing from developers is to apply Redis in new areas through modern data models. These models like JSON, Time series, Graph, and more can help give developers greater flexibility to build apps and are becoming quite popular. They don't require the app to conform to your database in a certain way. This innovation across different data models within Redis provides developers the ability to store the type of data they want for their app without having to translate and change it to another database.

We are seeing this phenomenon from greenfield to brownfield applications. It all comes down to the digital experience developers are trying to build and scale to. If you are going to scale it to the level of growth at Freshworks or SonyLIV, for example, then you need to have high availability for peak events in a cost-effective way.

Q. How is Redis positioned in terms of pricing?

A. We have benchmarks that show Redis Enterprise Cloud is one of the most cost-effective data platforms, at scale. When it comes to its adoption by developers, we want to make things easy. You can use Redis Enterprise Cloud for free with up to 30 megabytes of storage and advanced data model capabilities. We then allow customers to grow based on their needs. At the end of the day, however, we win on value. I would rather compete on the services, features and support that I offer to our customers.

Q. How has the journey been with customers who use open source?

A. The beauty of open source is that it gives us a leg up and momentum with developers, and allows us to proliferate into the market. What I firmly believe is that as our growth with an organisation happens, we need to support our customers with expertise and solutions to solve problems. Our enterprise-grade Redis platform is the data layer for their production apps. Product-led bottom-up growth is now seen as the most efficient way to seed and acquire new customers.

Q. Any specific initiatives for supporting developers who may not be in your customer segments?

A. Redis University is a great source of content and training for any aspiring developer. Redis has been constantly ranked as one of the highest paying technology skills for developers,

so this is an important focus for us to support. Developers, regardless of their experience or whether they are a paying customer, can achieve Redis certifications through proctored testing with a small, minimal fee.

Q. Can you shed some light on the initial public offering (IPO) plans?

A. Our focus is on the continual growth of the business and building the Redis community as fast as we can. Our annual RedisConf this spring was the largest ever despite the challenges of entirely moving to a digital format for the second consecutive year due to the pandemic. Many customers and prospects engaged with each other, which was exciting to see in the face of online meeting fatigue. An IPO is just one of those milestones that will come in time, with the right market conditions.

We remain focused on hitting our business objectives as of now.

Q. Are there any broad numbers that you would like to share with respect to Redis?

A. This year, close to 5,000 people attended our live sessions at our second virtual RedisConf. One of the stats that we are looking at very closely is Docker launches of Redis databases. At the beginning of 2021, an average of 6 million Redis databases launched from Docker Hub daily. To understand why this shows the vibrancy of Redis, that's more than double any other database, including MongoDB. Following this year's RedisConf, we've seen that rise to 7 million launches daily. **END** 🐼
