

Configuring Git and GitHub on Windows

This article gives a short tutorial on how GitHub can be configured on Windows. The task is not as simple as it is on Linux, though, but worth a try.

As most of us are aware, GitHub hosts software projects, applications and functions as a version control, using Git. The latter is basically used for tracking changes in

a set of files shared among coders who work together to develop software.

Unlike Linux, using Git on Windows is not easy and requires a few more steps that are mostly user interface (UI) based. The main steps are as follows.

To download and install Git on Windows, go to <https://git-scm.com/downloads> and click on the Windows option.

Once Git is downloaded, run the .exe file for installation using the UI, as shown in Figure 2.

The last step of installation is checking the Git interface option. The Git bash interface will open up. Enter the following command to check which version of Git has been installed, as shown in Figure 3:

```
git --version
```

To initiate the repository in a folder that we want pushed to GitHub, create a folder and file using the following commands:

```
mkdir hello
cd hello
```

Now, create a file with some content. Next, come back to Git Bash, and use the following command to initiate a Git

Downloading Git

Your download is starting...

You are downloading the latest (2.33.0) 64-bit version of Git for Windows. This is the most recent maintained build. It was released about 1 month ago, on 2021-08-24.

[Click here to download manually](#), if your download hasn't started.

Other Git for Windows downloads

Git for Windows Setup
