

The Evolution of JavaScript

JavaScript has evolved amazingly over the last three decades, and has a great future. This article recalls a few landmarks in this evolution, and tells us why this language is so popular today.

The World Wide Web was created in 1990 by Sir Tim Berners-Lee (Figure 1). This was the first Web browser and worked only on the proprietary software of NeXT computers, which were in limited use then.

Line Mode browser

The Line Mode browser was the second Web browser ever created. It was the first to be portable to several different operating systems. Being operated from a simple command-line interface, it could be widely used on many computers and computer terminals throughout the Internet, as seen in Figure 2.

Mosaic Web browser

The Mosaic Web browser was released in 1993, as the first browser with a graphical user interface accessible to non-technical people (Figure 3). It played a prominent role in the rapid growth of the nascent World Wide Web.
