

Android 12 released to the Android Open Source Project

Google has released the source code for Android 12 to the Android Open Source Project (AOSP) and officially released the latest version of Android.

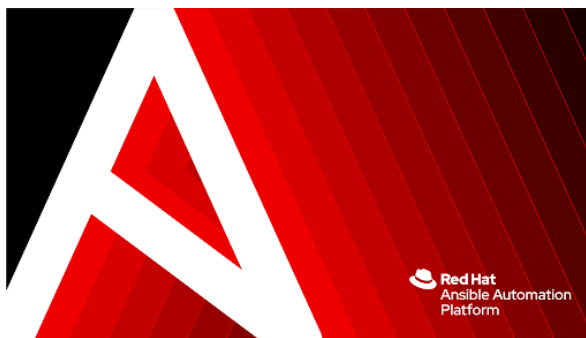

The latest release is said to come with great new features and APIs for developers.

Android 12 introduces a new design language called Material You, helping to build more personalised apps. To bring all of the latest Material Design 3 updates into apps, the company advises to look for an alpha version of Material Design Components and support for Jetpack Compose.

It revamps the existing Widgets API to improve the user and developer experience in the platform and launchers. It also has a new unified API that lets your app receive rich content from any available source: clipboard, keyboard, or drag and drop.

Android 12 comes with a new app launch animation for all apps, which includes an in-app motion from the point of launch, a splash screen showing the app icon, and a transition to the app itself. It introduces `RoundedCorner` and `WindowInsets.getRoundedCorner(int position)`, which provide the radius and centre point for rounded corners. It also expands the tools for creating informative haptic feedback for UI events, immersive effects for gaming, and attentional haptics for productivity.

“Game developers can now access multiple, different actuators independently in game controllers to deliver the same effect synchronously or different haptic effects on multiple actuators. For developers, we recommend using the constants and primitives as building blocks for rich haptic effects – constants to enhance UI events and haptic composer to sequence primitives for more complex effects,” read an official blog post.

enterprise data centre to remote network edges. Ansible Automation Platform 2 is now fully restructured for a hybrid cloud-native world, making it easier for IT teams to address automation needs at scale across varied environments and systems in a standardised way. With the automation controller (formerly Ansible Tower), users can more reliably and consistently scale automation on demand, taking a systematic approach to standardising automation practices while helping to reduce automation irregularities across the enterprise.”

The capability connects disparate automation components together and provides status checks on automation environments across the IT estate. The automation mesh is designed to connect across diverse environments with dispersed networks for more flexibility and resiliency without sacrificing security features, so enterprises can better adopt and scale automation.

Ansible Automation Platform 2 introduces the concept of automation execution environments (taking the place of Ansible Engine), which deliver self-contained automation spaces that can be easily replicated and repeated across an organisation. Automation content navigator helps teams quickly validate that automation content is working as it should across even the largest environments. This helps automators, from developers to sysadmins, maintain operational consistency across their systems.

AlmaLinux OS Foundation membership open to the public

The AlmaLinux Foundation has announced membership options for all project contributors and community members.

providers to the community, as well as official sponsors for the project,” said an official release.

The AlmaLinux Foundation is set up as a 501(c)(6) non-profit, the same model used by the Linux Foundation. There are currently three membership options available – contributor membership, mirror membership and sponsor membership

Those individuals or entities who wish to financially support the foundation may do so by applying for a sponsor membership. There are several possible tiers reflecting the different levels of contributions. This is the only membership type that includes a monetary contribution.

The company said, “As hybrid and multi-cloud computing become critical IT components, IT organisations need automation platforms that can bridge traditional systems with these modern services, stretching from the

This foundation is the entity behind AlmaLinux OS, the forever-free enterprise-grade Linux distribution. A member will have a voice in the direction of the project, and can vote for and be voted into the board of directors by other members. “There are several pathways available for becoming a member, including project contributors, mirror maintainers and service
