

“It is vitally important that free and open source software foundations be supported to maintain their independence and allow them to serve the community as intended, and that is what the AlmaLinux community is doing,” said Daniel Pearson, COO of KnownHost, LLC.

“All membership applications are considered and accepted based on the merit of the application and the contribution record of the applicant,” read a press note.

Google invests US\$ 1 million to reward developers for OSS security

Google has announced sponsorship for the Secure Open Source (SOS) pilot programme, run by the Linux Foundation. The company has planned to start with a US\$ 1 million investment to financially reward developers for enhancing the security of critical open source projects. This follows Google’s earlier US\$ 10 billion commitment to open source security.

The evaluation will be based on the guidelines established by the US based National Institute of Standards and Technology’s definition in response to the recent executive order on cybersecurity. Other factors include whether the project is included in the Harvard 2 Census Study of most-used packages, and whether the issue being resolved has a score of 0.6 or above in the OpenSSF Criticality Score project.

Specifically, the programme is focused on rewarding the software supply chain security improvements, including hardening CI/CD pipelines and distribution infrastructure, adoption of software artifact signing and verification, and project improvements that produce higher OpenSSF scorecard results.

Rewards will be determined on the complexity and impact of work, ranging from US\$ 10,000 or more for complicated, high-impact and lasting improvements that almost certainly prevent major vulnerabilities, to US\$ 505 for small improvements that have merit from a security standpoint.

Upfront funding is available on a limited basis for impactful improvements of moderate to high complexity over a longer time span. Those requests should be provided with a detailed plan of how the improvements will be delivered.

Only work completed after October 1, 2021, qualifies for the SOS rewards.

CodeSee releases OSS Port

CodeSee, a developer platform that helps to understand codebase, has released OSS Port — a platform connecting OSS projects to people, with tools to help developers overcome the barriers to taking on codebases.

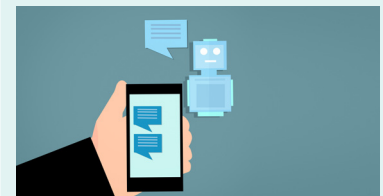

The company has also raised US\$ 3 million in seed funding, co-led by Boldstart Ventures and Uncork Capital, with participation from Precursor Ventures, DCVC, and Salesforce Ventures, along with several angel investors.

“Contributing to and maintaining open source projects is hard, no matter

USU launches open source project for multi-chatbot architecture

USU, the IT and customer service solutions provider, has launched a chatbot ecosystem called the USU Bot Universe, creating new application areas for bots. Since a single chatbot can only cover limited areas, this intelligent and flexible combination of dialogue systems as a network of expert chatbots will serve customers more efficiently and accurately.

USU Bot Universe is a free and open source bot communication protocol provided on the basis of JSON for any type of chatbot. As part of the open source project, the company assumes an administrative role, and provides the universal communication protocol and exchange platforms for the USU Bot Universe community free of charge. In return, the community can assist in developing the project in new directions. The development of further integrations will enable the use of a variety of chatbots based on different technologies.

The architecture concept divides chatbots into two roles: expert bots and a lead bot. The expert bots are registered in the network and can provide information on narrowly defined topics. The other role, the lead bot, acts as a concierge, first communicating with users and connecting them with the appropriate expert bot. The lead bot acts as a moderator and single face to the customer, while the expert bot is responsible for actually answering the specific questions. These modular bots allow for easy maintenance and servicing by editors. If a new topic is added, another bot can quickly be created and added to the network.
