

- Drag the calculated field 'Colour Indicator' to *Colour*.
- By default, it will show the assigned colour, but we may change the colour. Click on *Colour* to edit *Colours*, and choose the appropriate one.

So, we have learned how to apply filters and colour to make it easier to focus on the areas of your data that interest you the most (Figure 5).

Trend Line

- Go to *Show Me* and choose the *Dual Combination* chart to get the chart showing the Trend Line.
- From *Analytics*, drag and drop *Trend Line* over the chart. Any type of Trend Line can be selected — linear, exponential, logarithmic, etc.

Dashboard

Dashboards are used to display multiple worksheets at once, enabling one to compare a variety of data simultaneously. Let's see how to create a dashboard.

- In the *Dashboard* pane on the left, you'll see the sheets that you created.
- Click on the window-like icon next to the 'New Worksheet' icon in the bottom panel.
- Drag these worksheets from the pane to the empty area 'Drop sheets here'. The Dashboard will automatically make space available for the worksheets we have dragged, as shown in Figure 7.

Story: Bringing it all together

- A Story is where you combine all the dashboards, and if need be individual sheets as well.

- Click the *New Story* tab.
- In the lower-left corner of the screen, choose a size for your story.
- To start building your story, double-click a sheet on the left to add it to a story point. In *Tableau Desktop*, you can also drag sheets into your story point.
- Click *Add a caption* to summarise the story point.
- You can add another story point by Clicking *Blank* to use a fresh sheet, and start customising a story point.
- You can present your story by clicking the *Full Screen* button in the upper-right corner of the browser.

So let's combine all those Dashboards that we had made into what could perhaps make a decent presentation for a beginner. Do ensure to add a caption to all your Dashboards,
