

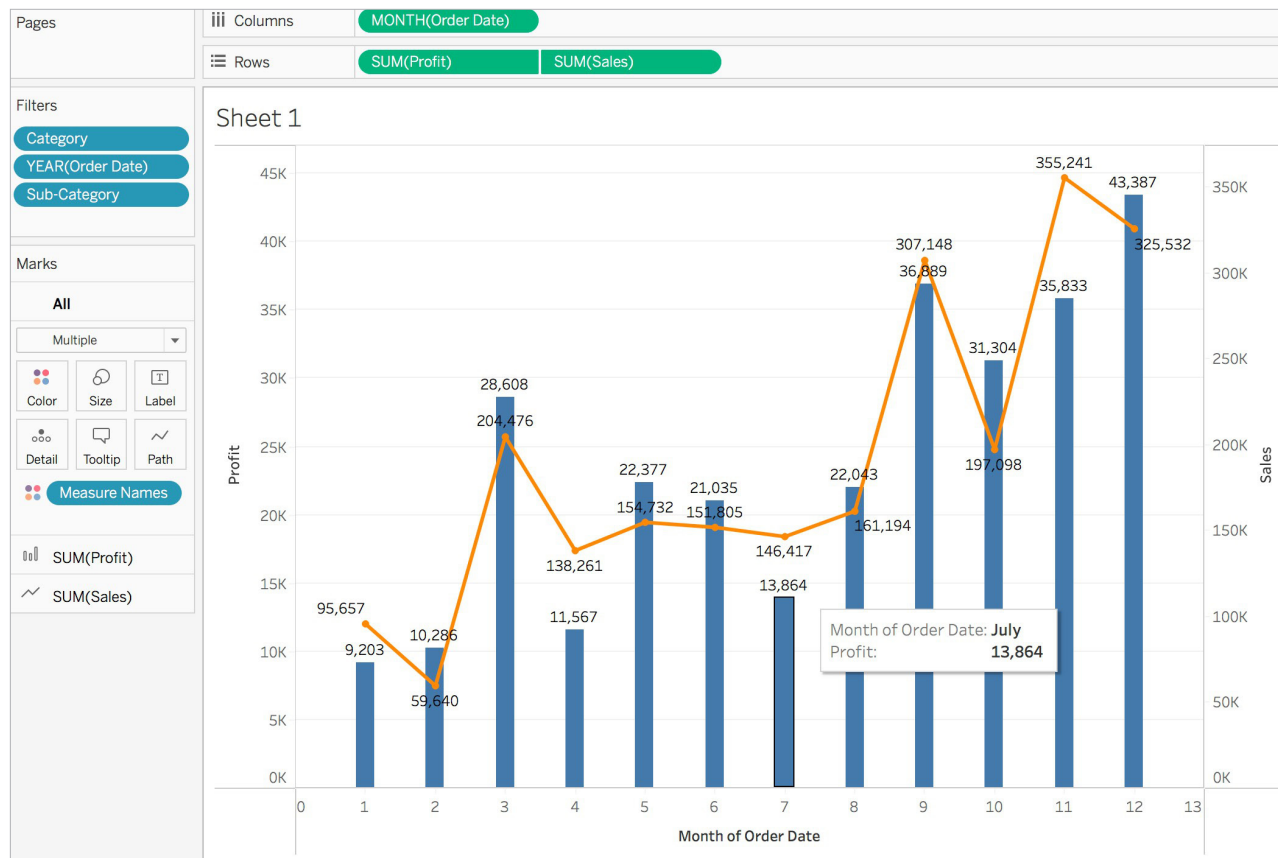

Figure 8: Trend Line

to convey your message clearly, as seen in Figure 8.

Saving the work

In Tableau Desktop: To save a Tableau workbook locally, select *File > Save*. Specify the workbook file name in the *Save As* dialog box. Tableau, by default, saves the file with the *.twb* extension.

In Tableau Public: With Tableau Public, all the views and data are made public and anybody on the Internet has access to it. Select *Server > Tableau Public > Save to Tableau Public* and enter the credentials.

In Tableau Server: In case the data is confidential, and the story needs to be shared with the entire team, Tableau Server comes in handy. To publish a story to Tableau Server, select *Server > Publish Data Source*. But make sure to create an account first.

To sum up, Tableau is the most popular and intelligent data visualisation tool available in the market, as it allows users to design charts, maps, tabular and matrix reports, stories, and dashboards with a simple drag and drop functionality. Tableau is faster than other BI tools and doesn't require any prerequisite or technical knowledge. Apart from screenshots, the only way to share Tableau Public visualisations is to publish them to the

Tableau Public website, for which you will need to create a Tableau account. In addition, when you share a Tableau Public visualisation, any viewer will be able to download the underlying data, unless you purchase a 'premium' Tableau Public subscription.

There's a lot more that can be done with Tableau. This article covers the very basics of this business intelligence tool that allows anyone to visualise and create interactive dashboards. **END** 🐧
