

The resulting curated library of public and private sources can then be used to help bankers, asset owners, asset managers and regulators assess climate risk and opportunity as elements of financial decision-making. OS-C is a non-profit, non-competitive organisation that seeks to use open source technology and collaboration to align the efforts of the financial community in addressing the challenge of global climate change, while preserving the opportunity to innovate and compete in global capital markets.

OS-C's members include Allianz, Amazon, BNP Paribas, Goldman Sachs, KPMG, Microsoft, the Net Zero Asset Owner Alliance and many more technology and financial leaders, with membership having tripled since the community's launch in September 2020.

The open source model used by Red Hat and selected by OS-C is intended to enable the creation of a complex, multi-layered ecosystem for OS-C members, including an open data platform that can be adopted by individual organisations for their own specific uses. This helps to provide a more level data playing field that meets a variety of regulatory requirements, providing global financial institutions with better, deeper views to evaluate climate change risk and opportunity as a core part of finance, banking and investment strategies.

As part of its membership, Red Hat will commit a team of eight solutions architects, data engineers and software engineers to the project, emphasising the creation of OS-Climate Data Commons. The company will also provide community management resources to help OS-C establish the proper infrastructure and collaboration processes to effectively engage its membership.

Linux Lite launches 'pay what you want' model with version 5.6

Linux Lite has announced Linux Lite 5.6, the final version in its 5.x series of releases. This release brings some major changes, including updates to the Help

Manual (an extensive and easy to follow Linux Lite guide), an updated Papirus icon theme, two new features added to Lite Tweaks, the introduction of the 'pay what you want' digital download model, seven new wallpapers, Python default version now set to Python3, and a host of

bug fixes and enhancements. "If you are coming from Windows, you will find this to be a solid, stable release that will help make your transition to a Linux based operating system, user friendly," the company noted.

Lite Tweaks now has complete Brave Browser support for cleaning the cache and setting as the default Web browser. In the Linux Lite 'pay what you want' download model, the user is encouraged to pay to obtain a download link. Users are still allowed to obtain the link free of cost by entering \$0. However, it does not support the distro.

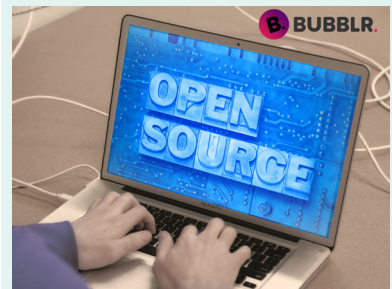

"This is a road I'd never thought I'd go down, but we have no choice. Either we stagnate and accept the big G's ever changing algorithms, or we boldly go where others have dared," said Jerry Bezencon, Linux Lite creator.

DigitalOcean acquires serverless platform provider Nimbella

DigitalOcean Holdings has announced the acquisition of Nimbella, a serverless platform provider. The acquisition expands DigitalOcean's capabilities into the rapidly growing function-as-a-service (FaaS) market, and will add an additional serverless

Bubblr announces open source platform for developing ethical digital solutions

Bubblr, Inc. has announced that it will make its patented IP available to developers and companies alike as an open source platform for the development of ethical, consumer-facing, B2B, and academic digital projects and products. The Bubblr platform will enable developers to create advertising-free networks, autonomous payment platforms and a host of other private, decentralised and distributed applications across a broad range of industries and non-profit sectors.

It said that the platform will also create new monetisation opportunities for content creators. Bubblr will bring together industry leaders, content champions and developers around the world to embed all or parts of the new monetisation code into their own apps.

Rik Willard, Bubblr's chief strategy officer, said, "Our platform will be designed in a manner that encourages others to join with us to create a better, more secure, and fair Internet through the development of next-generation Web tools and products. Our PaaS (Platform-as-a-Service) automatically embeds 'ethically sound' code into mobile apps, which creates a watershed moment for creators."

The company's first platform version currently in development is slated for release at the end of Q1, 2022.
