

Google sponsors security reviews of critical open source software projects

Google is pledging to provide US\$ 100 million to support third-party foundations that manage open source security priorities and help fix vulnerabilities. The company has announced support for the Open Source Technology Improvement Fund (OSTIF), with plans to sponsor security reviews of eight critical open source software projects.

Google's support will allow OSTIF to launch the managed audit program (MAP), which will expand in-depth security reviews to critical projects vital to the open source ecosystem. The eight libraries, frameworks and apps that were selected for this round are those that would benefit the most from security improvements and make the largest impact on the open source ecosystem that relies on them, noted a company blog.

The projects include Git, Lodash, Laravel, Slf4j, Jackson-core and Jackson-databind, and Httpcomponents-core and Httpcomponents-client.

This move comes after the company unveiled a US\$ 10 billion cyber security commitment to support President Biden's plans to bolster US cyber defences.

DataStax announces serverless database for deployment in multiple cloud provider regions

DataStax has announced that its flagship cloud database, Astra DB, can now easily be deployed in multiple cloud provider regions. It said that Astra DB can dramatically reduce the cost and complexity of replicating geo-distributed databases with always-on business continuity and built-in disaster recovery.

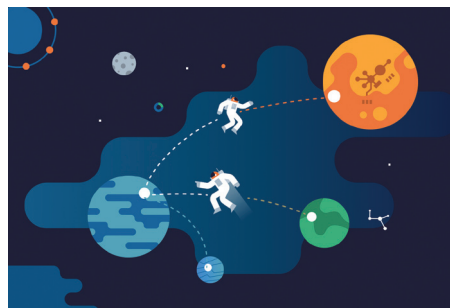

Astra DB is built on Apache Cassandra, the open source database used by companies such as Apple, Netflix and Walmart and thousands of others for demanding projects that need to deliver massive amounts of data to users around the world with zero downtime. DataStax has been focused on bringing the power of Cassandra to every developer and enterprise, for any project.

Ed Anuff, chief product officer at DataStax, said, "Digital delivery in 2021 means low-latency global availability of data. Developers expect this type of capability on-demand with zero complexity. We are proud to deliver on this promise with the release of Astra DB Multi-Region. No longer the purview of just large global enterprises, it's now essential for many organisations to have data available anywhere in the world to reliably and consistently deliver the digital experiences their customers demand. With Astra DB, any organisation can now afford to deploy databases in multiple regions to

quickly serve customers and benefit from always-on business continuity and disaster recovery."

DataStax's Astra DB with new multi-region support enables cost-effective always-on global expansion and puts data where users are to deliver seamless digital experiences by reducing data latency. It eliminates additional overhead for business

continuity and disaster recovery with a pay-as-you-go model. Astra DB helps to keep applications and services always-on using the nearest cloud region deployment and back up, as well as select geographic locations and cloud providers including Amazon Web Services (AWS), Microsoft Azure and the Google Cloud Platform (GCP). It also helps to meet data privacy and localisation compliance requirements by having specific data in specific geographic locations.

Mirantis releases Mirantis Flow

Mirantis, the open cloud company, has announced Mirantis Flow, a vendor-agnostic, cloud-native data centre-as-a-service aimed at businesses currently using costly, lock-in cloud infrastructure technology. It aims to modernise infrastructure while enabling both virtualisation and containerisation for all application types. Mirantis Flow also simplifies on-boarding for businesses just beginning their cloud journey.

The company said that Flow takes just about five days to deploy and run a centrally managed, scalable cloud infrastructure providing virtualisation and containerisation in the data centre, on public cloud and out to the edge.

Adrian Ionel, CEO and co-founder of Mirantis, said, "As more businesses pursue digital transformation, enterprise data centres are challenged to deliver a true cloud experience to their users while also reducing costs. Until now, cloud-native was sold and marketed as piece parts for enterprises to assemble. Mirantis has already helped hundreds of today's tech savvy companies, including Booking.com, Reliance Jio, and Societe Generale, implement an open source, cloud-native approach to infrastructure."

Mirantis Flow replaces legacy infrastructure software with modern open source software built with cloud-native architecture. According to the company, it reduces required hardware by 50 per cent or more. It uses open source software defined storage and networking, increases automation and frees up staff from routine administration work.

The company said, "Mirantis Flow integrates many open source technologies in a flexible way and packages those as a subscription service. Flow can utilise existing computing hardware and includes Mirantis Container Cloud for providing deployment and life cycle management of Kubernetes cluster across multiple infrastructure platforms."
