

Microsoft joins OpenInfra Foundation as platinum member

Microsoft has joined OpenInfra Foundation as its newest platinum member. The OpenInfra community will work closely with Microsoft to advance open infrastructure use cases, including hybrid cloud and 5G, through participation in and contribution to several open source project communities.

In a presentation to the OpenInfra board of directors, Ryan van Wyk, partner software engineering manager for Azure for Operators at Microsoft, said the multi-year commitment to support the OpenInfra Foundation is Microsoft's latest move to support a vibrant and diverse ecosystem of open source projects and communities. Through this membership, Microsoft will represent the interests of its telecom customers in the OpenStack and broader OpenInfra community. It will actively contribute to several OpenInfra projects, and look for opportunities to integrate these projects into the Microsoft Azure product roadmap as it evolves.

The OpenInfra Foundation hosts open source projects and communities of practice, including infrastructure for AI, container native apps, edge computing and data centre clouds. Its projects include Airship, Kata Containers, OpenInfra Labs, OpenStack, StarlingX and Zuul. Most recently, the OpenInfra Foundation has begun supporting the Magma 5G project.

Microsoft will continue collaborating with the OpenInfra community around network cloud requirements and driving the adoption of cloud technology for core network workloads.

Mark Collier, COO of the OpenInfra Foundation, said, "Microsoft joins an impressive group of companies as a platinum member of the new OpenInfra Foundation, including Ant Group, Ericsson, Facebook, FiberHome, Huawei, Red Hat, Tencent and Wind River, all of whom bring their expertise operating infrastructure at scale to the community, writing open source software for the next decade of OpenInfra. This includes software like OpenStack, which now powers 9 of the top 10 telecom networks in the world, Kata Containers which secures the world's largest payment network, and Airship which powers the AT&T 4G and 5G networks in production today."

Aqua Security and IBM to bring cloud native security to Power10 based systems

Aqua Security has announced that it will be the first cloud native security PartnerWorld partner supporting the launch of the new IBM Power10 based IBM Power E1080 server. Aqua Security will provide new tools to help customers better secure the full life cycle of Red Hat OpenShift based containerised workloads on IBM Power servers.

The company said, "IBM Power10 is architected from the ground up to be one of the most secure server platforms, designed to protect data from on-premises to cloud with new security features including end-to-end memory encryption and accelerated cryptographic performance with four times the crypto engines per core compared with IBM Power9. Aqua Security builds on this strong base by leveraging Aqua's unified, holistic platform to help customers mitigate the risks across the application life cycle in hybrid cloud native environments by delivering consistent visibility, build and image security, Kubernetes container orchestration infrastructure protection as well as run-time policy enforcement."

Aqua's embedded policies for cloud native workloads, including VMs, containers and serverless functions, are designed to help Red Hat OpenShift on Power10 customers further integrate security and compliance requirements for application modernisation, whether they deploy their applications on-premises or in the public cloud.
