

The Cloud is a Great Platform for Quantum Computing

Most routine applications are being deployed on the cloud today to avoid the complexities of maintaining data centres, servers, and network infrastructure. This article takes a look at cloud based implementation of quantum computing.

Applications can today be deployed on smart devices, gadgets, laptops or personal computers using cloud services. With increased deployment of these services, high performance applications are also getting connected to cloud data centres. These services include quantum computing, blockchain, microservices, Big Data analytics, and many others, as depicted in Figure 1.

Figure 1: Key services available on the cloud

Many of these services are very complex in terms of server management, devices, infrastructure and maintenance but are easily programmable on the cloud. There are various pre-built programming frameworks and development environments on the cloud that help programmers work on high performance applications without installation and troubleshooting of infrastructure.
