

ServiceNow acquires Swarm64, a database company

ServiceNow has signed an agreement to acquire Berlin based Swarm64, a database company, to gain a bigger foothold in the open source space. The acquisition is expected to complete in Q3 2021.

“The acquisition of Swarm64 signifies ServiceNow’s latest investment in open source. Swarm64’s open source-based database technology works extremely well for large scale data sets, ultimately helping customers obtain the enterprise-wide insights needed to handle high volumes of data transactions and run sophisticated

analytics in real-time,” wrote Joe Davis, senior vice president of platform engineering, ServiceNow, in a blog post.

ServiceNow has doubled the features and functionalities of the Now Platform to manage larger, more complex workflows

for the new world of hybrid work. The acquisition will help customers effectively manage data across many different use cases to execute complex, high-speed data analytics at a mass scale.

Swarm64 has three core products — the Swarm64 Database Accelerator, PG Nitrous, a PostgreSQL cloud database, and PostgreSQL performance engineering support. Pricing varies from free to monthly fees and by core per month.

Elementary OS 6 Odin released

Based on Ubuntu 20.04 LTS, elementary OS 6 is now available for download. It features a dark mode. The dark theme preference is also available in the *Welcome* screen right after one installs elementary OS 6.

Notification improvement is one of the features in this elementary OS 6 release. It supports action buttons and icon badges. To enhance privacy and security, elementary OS 6 provides Flatpak apps out-of-the-box. It also comes with multi-touch gesture for both the touchpad and touch screen.

Some new applications like Tasks and Firmware have been introduced with this release. A user can get warned when side loading an application outside the AppCenter. One also gets a warning if one tries to paste a command that needs root access in the terminal. It has online account integration support from the system settings and improved accessibility.

Interested readers can download the OS from <https://elementary.io/> along with the step-by-step installation guide.

Spectro Cloud’s new release will help Kubernetes to run on bare metal servers

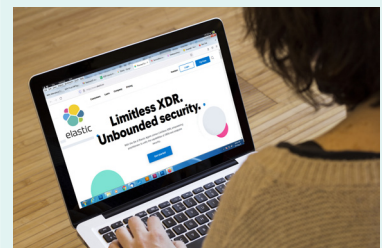

Spectro Cloud has released an open source CNCF Cluster API contribution supporting Canonical’s MaaS interface. The new contribution to the open source Kubernetes ecosystem addresses the need for organisations to easily deploy, run and manage Kubernetes clusters directly on top of bare metal servers, increasing performance and minimising cost and operational effort.

“Running Kubernetes directly on bare metal servers is the next big thing for the Kubernetes community, but it has been challenging and difficult to implement,” said Tenry Fu, CEO, Spectro Cloud.

Elastic announces centralised management of Elastic Enterprise Search

Elastic, the company behind Elasticsearch and the Elastic Stack, has announced updated App Search precision tuning capabilities, and content source flexibility and synonym support for Workplace Search in the 7.14 release of Elastic Enterprise Search. The latter can now be centrally managed in Kibana, the single management interface for all Elastic solutions.

With this beta integration, users can access App Search and Workplace Search features with consistent, cross-platform navigation in Kibana to create new engines, tune query relevance, manage user access, and customise visualizations. Elastic has also introduced precision tuning, now in beta, and available in Kibana and via the App Search API. Users can narrow or broaden their search results by adjusting precision and recall settings on their search engine with an easy-to-use precision tuning slider.

Elastic has introduced the general availability of a new indexing flexibility to prebuilt data integrations with more configurability for content source synchronisation in Workplace Search. With 18 out-of-the box content sources, customers can specify which objects to synchronise or exclude when ingesting content sources, including object type, path or location, file type, and field. Synonym support is also available in Workplace Search.
