

Systemd in 'bullseye' activates its persistent journal functionality, by default, with an implicit fall back to volatile storage. This allows users that are not relying on special features to uninstall traditional logging daemons and switch over to using only the systemd journal.

Adobe fixes critical vulnerabilities in Magento open source

Adobe has announced that it has patched multiple critical vulnerabilities for Magento 2, which could allow attackers to take over administrator sessions and also grant access to customer details. The vulnerabilities affecting the popular Magento

platform are said to affect both the open source and commercial versions.

The Magento Open Source release includes over 370 new fixes to core code and 33 security enhancements that help close remote code execution and cross-site scripting (XSS) vulnerabilities. It also contains the resolution of

almost 290 GitHub issues and community contributions, ranging from minor clean-up of core code to significant enhancements in GraphQL.

While there are no confirmed attacks related to these issues till date, Adobe said certain vulnerabilities can potentially be exploited to access customer information or take over administrator sessions.

Adobe has released additional security enhancements like a new composer plugin to prevent dependency confusion, rate limiting to API to prevent DoS attacks, and more.

Zorin OS 16 Linux distro released with new features

The most anticipated Linux distro Zorin OS 16, based on Ubuntu 20.04.3 LTS, has been released with a new 'Pro' edition. The Zorin OS 'core' is free with all essentials. The new distro comes with many key updates.

The base edition has an upgraded user interface, revamped default theme with animations, while the Pro version comes with new wallpapers and layouts. One of the new key updates is the Jelly Mode. On enabling it, the windows wobble when moved around the desktop and squeeze into their app icons when minimised.

The new version comes with a revamped welcome screen and new touchpad gestures, sound record app, and other performance improvements. The new desktop layout in Zorin Appearance resembles the default interface in Windows 11. It features a modern and streamlined UI that adapts well to computers with touchpads, mice, or touchscreens. The new grid menu, activities overview button, and taskbar icons are placed front and centre for easy access and navigation on screens of all sizes. The Windows 11-like desktop layout is available as an option in Zorin OS 16 Pro.

Zorin OS 16 uses a database of Windows software to detect .exe files if downloaded, which is a useful support for beginners when installing software on Linux. Though it does not have exact instructions, it prompts to install 'Windows App Support'.

The OS is currently available for download on Zorin's website. The company said other editions of Zorin OS 16 – Lite and Education — will be released over the coming months.

Apollo GraphQL announces US\$ 130 million Series D investment

Apollo GraphQL has announced a US\$ 130 million Series D funding round led by New York based global private equity and venture capital firm Insight Partners, with participation from existing investors including Andreessen Horowitz, Matrix Partners, and Trinity Ventures. Additional investors are Next47 and Hatim Shafique, chief customer officer at DataBricks.

Apollo is pioneering the Graph as an essential new layer in the tech stack that serves as a unified representation of an organisation's services, data, and digital capabilities. The Graph empowers developers to deliver better experiences, faster; isolates service complexity; and serves as a single place for application development collaboration, without coupling.

Geoff Schmidt, co-founder and CEO of Apollo GraphQL, added, "The Graph is a developer-driven movement to change how companies build software, and Apollo is leading in supporting application developers, the primary value creators in software. Every company will need a graph strategy to keep pace in the digital era the same way they need a cloud strategy. This round is a win for

all application developers, who can expect increased support for our

open source community, as well as our forward-looking customers."

"Apollo has brought the revolutionary technology of GraphQL to the enterprise through its commitment to the open source community and making the Graph a foundational pillar to the tech stack," said David George, general partner at Andreessen Horowitz.
