

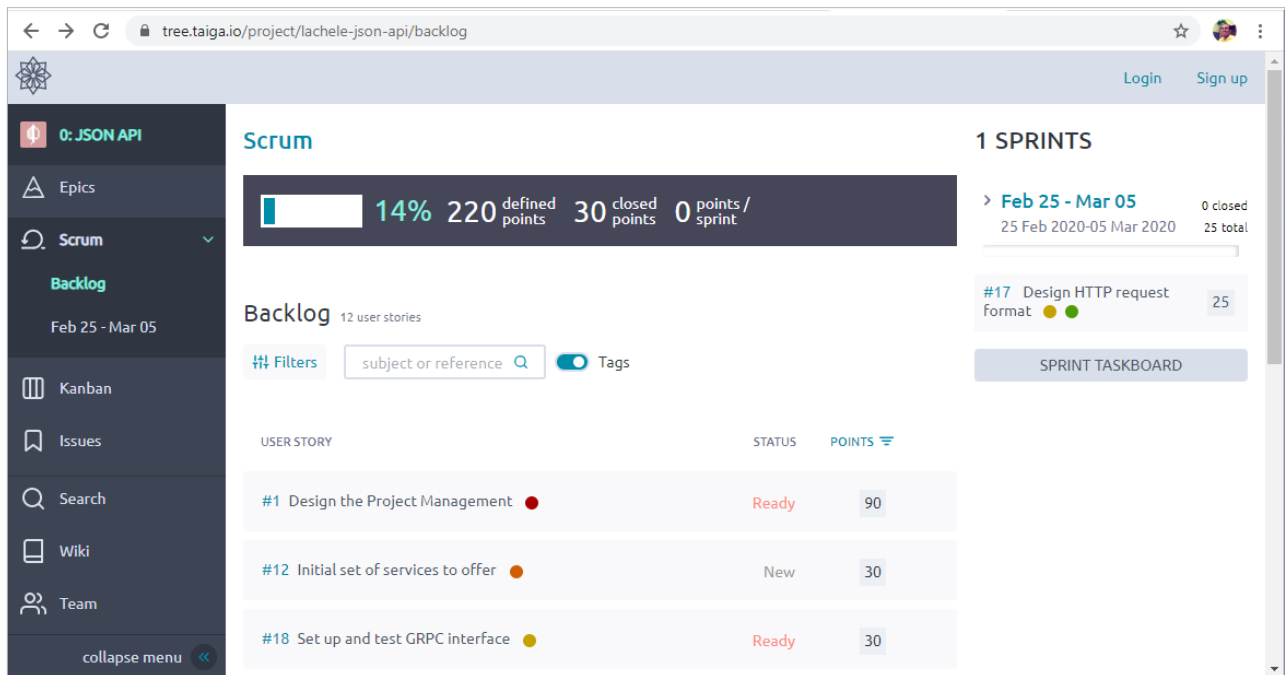

Figure 3: Taiga Scrum backlog

Other common features

Both tools offer the ability to set up one Wiki per project so that you can maintain project related documentation in an easily editable format. Taiga has a Google Groups forum, where you can browse questions and issues raised by users, as well as responses from other users and the vendor. Tuleap instead has Slack style chat where this user discussion takes place. You will have to register to get access.

Other open source tools in this space and why they are not recommended

IceScrum: Many modules (called Apps) and integrations are available only in the paid version.

Agilefant: On its website it's claimed that, "While the open source version does not have all the latest features, it is under active development and enjoys steady progress." However, I have not seen any commits in the open source code in the last six years.

OpenProject: OpenProject, and also some of the other project servers, have back-fitted Scrum capability on an otherwise issue tracking or project management software. If you are already operating one of these, convenience may dictate that you try their Scrum features. However, if you are starting afresh, one of the born-

agile software tools featured above is recommended.

Challenges and rewards of Web based apps

Installation, maintenance and security are the challenges for setting up Web based apps with your hosting provider or in the cloud. You need in-house technical resources which can handle these. However, if you take on this challenge and build in-house capability, you will enhance the productivity of your employees, regardless of whether they are in the office, work from home or are deputed offshore. **END** 🐧
