

team. Acquia has implemented Drupal Steward protection across its entire Drupal Cloud platform, protecting thousands of the world's largest sites with up-to-date security and vulnerability fixes.

Malicious requests are blocked, giving IT teams the time they need to test and implement security updates on their own timelines. For instance, in November 2020, Drupal Steward implemented protection against a critical remote code execution vulnerability, immediately protecting Acquia's customers.

Robert Former, chief information security officer at Acquia, said, "We're pleased to be a part of this novel program to address always-evolving security risks. Our customers understand that if there's a critical security vulnerability, they'll be the first to benefit from enterprise-level support working with Acquia through Drupal Steward. Participation in Drupal Steward is a core part of Acquia's overarching commitment to deliver the most secure solution for hosting enterprise Drupal applications."

Facebook adds another feature to Data Transfer Project

Facebook has added two new destinations to move data from the social network. In its blog post, the company said that Facebook users will be able to move their images to Photobucket and Google Calendar, along with one more new data type – Facebook

Events. This is yet another feature added to the open source Data Transfer Project, developed by Google, Facebook and Microsoft to support innovation in data portability.

Hadi Michel, product manager, said that the TYI (transfer your information) tool has been "completely rebuilt" to be "simpler

and more intuitive," giving people more clarity on what they can share to which platforms. This will give them choice and control over their data. In addition, users can now precisely select and start multiple transfers to one destination.

Facebook says that governments will need to "make clearer rules about who is responsible for protecting that data as it is transferred to different services."

4MLinux announces its 37th release

4MLinux has announced its 37th major release. It said that four new applications

can be installed — Linux 5.10 LTS, LibreOffice 7.1.5, Firefox 90.0.2, and Thunderbird 78.12. This release has Linux kernel 5.10 LTS, which brings better hardware support and many small improvements.

It also comes with the Dmidecode tool for reading hardware-related data from SMBIOS, FluidSynth

software synthesizer, HandBrake video transcoder, and qBittorrent BitTorrent client.

The latest release comes equipped with many updated applications like LibreOffice 7.1.5, Firefox 90.0.2, Mozilla Thunderbird 78.12.0, Audacious 4.1,

Linux Foundation launches scholarships for women working with open source

Linux Foundation has announced its partnership with Women Who Code (WWCode), an international community to empower women in technology, for providing scholarships to encourage women working with open source software.

The Foundation will provide 50 scholarships per quarter to deserving candidates. Linux Foundation Training & Certification will provide each of these recipients with a voucher to register for any Linux Foundation e-learning course and certification exam at no charge, such as the Linux Foundation Certified IT Associate, Certified Kubernetes Administrator, Linux Foundation Certified System Administrator, and more.

The scholarship will help candidates gain and improve their skills, and certify them as they get ready for the industry. The exams will be monitored online via Web cam and screen-sharing. A retake will be allowed if someone fails the first attempt.

"Open source technology is leading so much digital transformation today — from cloud computing and networking to Web development, blockchain and more; yet there is a continual shortage of qualified talent generally, and fewer women pursuing these roles specifically," said Linux Foundation SVP and GM of training and certification, Clyde Seepersad.
