

Google rolls out Android 5.1 Lollipop to improve stability and performance

Google has announced that it is now rolling out Android 5.1 Lollipop, an update which improves stability and performance. It has several new features, including official support for multiple SIM cards, high definition voice

calling on phones that support this feature, device protection and more. This would be the first major update to Android Lollipop since its release.

Google made the announcement on its official Android blog, where it has been mentioned that 5.1 Lollipop will also provide enhancements such as the ability to join Wi-Fi networks and control paired Bluetooth devices directly from *Quick Settings* as well. With Android Lollipop 5.1, more than one SIM card can be used on a device with multiple SIM slots. Lollipop 5.1 will also come with high definition voice calling on mobile phones.

Google has added an additional feature called 'Device Protection' which protects your phone when you lose it or if it gets stolen. It will remain locked until you sign in with your Google account, even if someone resets your device to factory settings.

Ubuntu MATE 15.04 to ship with Tilda terminal app

The Ubuntu MATE team, which is currently enjoying its official community flavour status, is busy providing details about the new features that are being shipped with Ubuntu MATE 15.04—the latest being the addition of Tilda.

Tilda is a 'dropdown' terminal application which is quite similar to its popular alternatives like Guake. It is an important application for Ubuntu MATE.

Dropdown terminals are necessary to some extent. You will not be required to open an app any more with this application, as you will now only have to hit a hot key (for example F12 in Ubuntu MATE) to open and then shut it down. Tilda has several customisation and configuration options, and it supports multiple tabs too. It is available for installation on most versions of Ubuntu and related flavours, directly from the repositories.

Latest Intel Linux graphics drivers now available

A new version of the latest Intel Linux graphics drivers installer is now available for download, which gives users an easy way to upgrade Intel graphics drivers on supported operating systems.

'Intel Graphics Installer For Linux' is a free utility that can be used to install the latest graphics and video drivers for Intel graphics hardware. It is developed and maintained by Intel Open Source Technology Center. It allows you to stay up to date

MakuluLinux Cinnamon upgraded to 64-bit version

MakuluLinux Cinnamon has been upgraded to a 64-bit version. This Linux distro is based on the Debian testing branch, Jessie, and it's known to provide stability, speed and modern desktop features.

Until now, MakuluLinux was a 32-bit distro only, but now it has an upgraded edition too. The Cinnamon flavour is quite popular because it is lightweight. It will not only be compatible with 64-bit machines, but it also integrates a new and interesting feature that allows users to save a snapshot of their current desktop, package it and install it on another computer. MakuluLinux is already very comfortable for new users. It's based on Debian, and it directly competes with Linux Mint.

The developer has posted, "This release is special for so many reasons. It is sure to mark a major milestone, not just for Makulu, but considering what is inside, the whole of the Linux world. Never before has Linux offered such options as we have done in this release, and what is more, we made it so easy to use. Makulu now offers a built-in constructor tool that lets you quickly and easily create a 100 per cent snapshot of your LIVE system as it is, and save it into an ISO that can be then re-installed on a new computer. It comes complete with a live mode, installer and full EFI/Secure boot."

As per the changelog, the Linux kernel is now at version 3.16, the Cinnamon desktop environment has been upgraded to version 2.2.16, EFI support has been integrated, and firewall and antivirus applications have also been added.
