

SUSE launches its own open source storage solution

SUSE has released its own storage solution for enterprise customers. The open source storage is powered by Ceph's Firefly open source project and the solution is highly scalable.

Nils Brauckmann, GM, SUSE, said that SUSE Enterprise Storage is a highly scalable and resilient software storage solution that lets small organisations and enterprises move from proprietary, hardware based storage to software based storage, which ensures great functionality at negligible cost.

SUSE has designed this software based storage solution with easy back-up and archiving capabilities for enterprise customers. It has priced this solution well—charging \$0.001 per GB for enterprise users. SUSE's vision has been to bring cost-efficient and highly scalable storage solutions to enterprises. The companies can build their storage space using commodity off-the-shelf servers and disk drives.

Enterprise customers can save a lot of the money being spent on expensive hardware with this solution. SUSE claims that this software based storage solution is 30 per cent less expensive than conventional NAS solutions and 50 per cent less expensive than average capacity optimised disk array systems. SUSE has designed this solution to be very flexible and scalable to serve an enterprise's need for more storage as the company grows. Customers can rapidly boot new virtual machines with SUSE Enterprise Storage. The service offers fault-tolerant enterprise disk storage.

SUSE has invested in OpenStack in the past so the company has no intentions of competing with it. Red Hat already has its own software based storage solution, so SUSE needed a cloud based storage solution to help serve the needs of its customers. It has integrated this new storage solution in SUSE OpenStack Cloud to provide flexible access. SUSE Enterprise Storage can also be used as a stand-alone storage solution.

version of Horizon 6 that can package server-based Red Hat and Ubuntu Linux desktops, so they can be accessed from remote computers and mobile devices.

Customers can use VMware Horizon 6 to leverage the power of virtualisation, and transform their desktops into secure virtual workspaces to embrace business mobility.

Virtual desktop infrastructure (VDI) software can be handy for organisations that have mobile workers who need to access applications and desktop environments from multiple devices. Virtual desktops can also simplify the large-scale management of software and operating systems.

The company has updated Horizon 6 with additional capabilities for managing 3D images and for integrating into software defined networks (SDNs).

Google Code to close down!

The search giant is closing down Google Code because there are other alternatives available on the Web. Google Code was a competitive alternative to SourceForge for open source project hosting.

Google launched the project in 2006 because it was unhappy with the 'limited' options available to the open source community. But since then, a "... wide variety of better project hosting services" such as GitHub and Bitbucket have moved to the forefront.

In May 2013, Google also shut down Google Code Download services. In order to "...meet developers where they are," Google

itself has transferred nearly a thousand of its own open source projects to the popular coding repository GitHub.

GitHub isn't just a place to download, but it has become a fantastic and integral part of the development process in a way that neither Sourceforge nor Google Code ever were. The migration of developers to the new services has left Google Code dealing with a deluge of spam and abuse.

The end of Google Code will be based on a timed approach. As of March 12, 2015, all new project creation has been disabled. On August 24, 2015, the site goes read-only and will effectively disappear on January 25, 2016.

Linux kernel 3.19.1 released

The first point release of Linux 3.19 kernel was announced with immediate availability for download. Linux kernel 3.19.1 is the current stable branch of the Linux kernel.

As per the changelog, the first point release of Linux kernel 3.19 comes with a number of improvements to several architectures including ARM, x86, PowerPC, MIPS, ARM64 as well as s390. The release also includes updates to drivers, file systems, networking, sound and security.

Developer Greg Kroah-Hartman said in the mailing list announcement, "I'm announcing the release of the 3.19.1 kernel. All users of the 3.19 kernel series must upgrade."

The 3.19.1 version brings updated
