

KompoZer

KompoZer is a lightweight application, but it is a good choice even for advanced programming tasks.

This open source IDE is a sweet deal—whether you're developing in PHP, Ruby on Rails, JavaScript or something else, you'll find rich editing features, as well as support for FTP and MySQL. With PHP, it offers light on-the-go debugging, alerting you to errors as you type. Whether you're working with Python, PHP, Ruby, Perl, HTML, CSS or JavaScript, KompoZer provides a clean, intuitive interface with advanced editing capabilities and integrated tools for the most functionality.

Cloud9

Cloud9 is an open source online IDE with the support of up to 40 programming languages. With a pre-setup workspace, collaborative coding features and Web development features, it allows developers to get started with coding immediately. Its source code can be found in <https://github.com/c9/core/GitHub>.

NetBeans

NetBeans is another open source IDE written entirely in Java by Oracle. It allows applications to be developed from a set of

modular pieces of software called modules. Though initially it was developed for Java programmers, it soon became popular for Web development. NetBeans is cross-platform and supports a compatible JVM.

Brackets

Brackets is an open source code editor written in HTML, JavaScript and CSS with a focus on Web development. It is licensed under MIT by Adobe Systems. Just like NetBeans, it's also cross-platform. Its features include Quick Edit (inline editing of HTML, CSS, colour properties and JavaScript), live preview (pushes code instantly to the browser, with no page refresh required), Quick docs, and more.

The above listed IDEs are among the many free or open source varieties available for developers. They are worth a try. 

By: Vinay Patkar

The author works as a software development engineer at Dell India R&D Centre, Bengaluru, and has close to two years' experience in automation and Windows Server OS. He is interested in virtualisation and cloud computing technologies.

```

    Ticker.setFPS(24);

    Ticker.addListener(this);
  }

  //function called by the Tick instance at a set interval
  function tick()
  {
    //check and see if the Shape has gone of the right
    //of the stage.
    if(circle.x > bounds.width)
    {
      //if it has, reset it.
      circle.x = circleXReset;
    }

    //move the circle over 10 pixels
    circle.x += 8;

    //re-render the stage
    stage.update();
  }
</script>

</head>
<body onload="init()">

```

```

<div width="400" height="300" id="canvasWrapper">
  <canvas width="400" height="300" id="stageCanvas"></
canvas>
</div>
</body>
</html>

```

To execute this sample script, follow the instructions given below:

1. Copy this script and paste it into *Notepad* and rename it *game.html*
2. Download the *easel.js* file and place it in the *Scripts* folder
3. Run *game.html* in the browser

Over the last few years, games built for browsers have been deployed on laptops, tablets, mobiles or any other computing device. With HTML5, we have the true power of writing an application once and deploying it anywhere.
