foundation for the Eclipse IDE. It is composed of plugins and is designed to be extensible through the use of additional plugins. Developed using Java, the Eclipse platform can be used to develop rich client applications, integrated development environments (IDEs) and other tools.

Eclipse can be used as an IDE for any programming language for which a plugin is available.

- The Java Development Tools (JDT) project provides a plugin that allows Eclipse to be used as a Java IDE
- PyDev is a plugin that allows Eclipse to be used as a Python IDE
- C/C++ Development Tools (CDT) is a plugin that allows Eclipse to be used for developing applications using C/C++
- The Eclipse Scala plugin allows Eclipse to be used as an IDE to develop Scala applications
- PHPclipse is a plugin to Eclipse that provides the complete development tools for PHP

## Introducing Servlet

Servlet technology is used to create Web applications and it uses the Java language to do so.

Web applications are 'helper applications' that reside in the Web server and build dynamic Web pages -- like a page that randomly chooses a picture to display or even a page that displays the current time.

As Servlet technology uses Java, Web applications made using Servlet are secure, scalable and robust.

The advantages of using Servlet are:

- Low response time because each request runs in a separate thread
- Servlet is scalable
- It is robust and object oriented
- It is platform independent

## The Servlet life cycle

- **Loading a Servlet class:** A Servlet class is loaded when the first request for the Servlet is received by the Web container.
- **Creating a Servlet instance:** After the Servlet class is loaded, the Web
