

Figure 1: Types of software testing

- User acceptance testing
- Release or deployment testing
- **Automation testing:** This type of testing is done using automation tools. It reduces the overall effort and time required in regression testing and speeds up the overall testing process. Various automation tools can be used for this. Some of these tools are:
 - HP Quick Test Professional
 - Selenium
 - IBM Rational Functional Tester
 - SilkTest
 - TestComplete

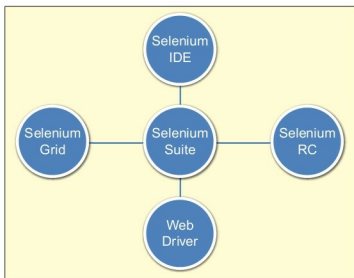

Figure 2: Selenium's components

- Testing Anywhere
- WinRunner
- LoadRunner
- Visual Studio Test Professional
- WATIR

Introducing Selenium

With the dynamic growth in the IT industry, there has been an increase in testing costs. So, organisations have started choosing open source automation tools rather than their commercial variants. Automation tools, as their name suggests, provide features for automating the

Elements	Description
Base URL	This is the textbox where the URL for the application under test can be specified. All open commands will be relative to the Base URL unless a full path is inserted in the open command.
	Speed slider is used to vary the speed while playing the test from Fast to Slow
	Play entire test suite button is used to run all the available test cases in the IDE
	Play current test case button is used to run a single test which is selected in the IDE.
	Pause/Resume button is used to pause/resume the test case which is currently running
	Step through the test once it has paused.
	This is the record button. This will be engaged when the test is recording
Command selectbox	It has a list of all the commands that are needed to create a test. It is a drop down box which specifies all the available command in selenium IDE
Target textbox	It enables to specify the element which is to be tested
Find button	It can be used to find any particular element on the application under test
Value textbox	It is used to specify the value for the target element if required. It is usually used when the requirement is to enter a value in the input box on the web page which is being tested
Test table	It will keep track of all commands, targets, and values
Log	When test case is run information message and error message are displayed in this tab
Reference	It will display the details about the current command
UI-Element	It is for advanced users
Rollup	It allows to execute group of commands in one step
