

Figure 15: Home page

`all/modules/contrib` directory. Now revisit the *Modules* page and see that the Webform module can be installed and automatically enables the prerequisite modules too.

The aim of this module is to provide you with a way to add more forms to your site using an easy form builder facility. It would have created a content type 'Webform' for you on the *Content types* listing page. You can now go ahead and create a form in the same way as creating a page. Go to *Add content* and see that Webform is listed as a type there. Click on it, and you will be asked for a title for the form and any menu, path or permissions that you would like to associate with the form. Once you add this information and save it, you will be led to the form builder page, where you can add text fields, select boxes, text area, date and other types of form components. Next, you can program what actions should be taken after submitting the form, like sending a confirmation message, email to the administrator, etc (Figure 14).

Themes

Drupal's UI architecture beautifully separates out logic, data and presentation. The features that govern the data architecture and logic are separated into the modules and the presentation layer is governed by the *Theme* layer. Drupal comes with a default theme, Bartik, which is enabled when you install it. Now, to change the appearance, install another theme, or create your

own theme and install it. The Drupal community has contributed over 2000 themes for you to start with. Some of them are base themes that put in a framework for you to build a branded theme and some give you a complete coloured theme. You can find them at https://www.drupal.org/project/project_theme.

Let's try one at <https://www.drupal.org/project/corporateclean>. Download the `.tar.gz` or `.zip` file, extract it and place it in the `sites/all/themes` directory. Now navigate to the *Appearance* page from the admin menu on top. It shows you a list of themes available and the one you just added.

Enable it and set it as the default in the *Corporate Clean* theme, and then navigate to the front page and see the magic (Figure 15).

A good start to building your site on Drupal

You are probably well into getting your site built on Drupal. For a quick try out, you can start building and hosting your site on Acquia's cloud servers, which provide developers with a free version to kickstart their Drupal development. Go to <http://www.acquia.com/free> to register for your free dev cloud. The Drupal community site hosts an awesome documentation section that provides details about working in the Drupal ecosystem. Do feel free to register on www.drupal.org and visit its forum section to interact with the Drupal community, post your questions and participate in local events. Drupal has been adopted by major systems integrators and IT companies to create great digital experiences for their customers. The Drupal community in India regularly organises events like the Drupal Camps in Delhi and Mumbai held earlier this year, 'Global training days' that happen every quarter, and many monthly meet-ups for training, code sprints or contribution drives. Come, join for the technology and stay on for the community.
