becomes cumbersome and hectic to go to individual sites and post an advertisement. CampaignChain provides a common platform where the user can choose whatever online channel is desired. There is an option to add sites, apart from those already being used.

The second hurdle is when we are unclear about scheduling a campaign, that is, when to post an advertisement on a specified channel. This tool has configured a feature to resolve this issue. All one has to do is create an activity and schedule it. (Creating a new post for a blog channel is an example of an activity.) The benefit of scheduling is that it saves a lot of time and lets you plan your campaign.

After posting the advertisement, one may want to know more about how the advertisement is being received, so statistics about the number of tweets, re-tweets, Facebook 'likes', comments, subscriptions or any other key parameters are welcome. This feature is well integrated in CampaignChain. All one has to do is paste a code snippet on the server pages and that's it. The monitor tab gives a chart of statistics collected per activity per online channel, along with data on how the marketing budget has been utilised. Statistics give a clear indication about how many leads have been generated per campaign and which activity has the highest impact. This helps in deciding future marketing plans. As an example, the video of the 'Clean India' campaign or the Ice Bucket Challenge gained a lot of views on YouTube as compared to the 160-character quote on Twitter on the same topics. So more emphasis was given to online video channels for promoting the campaign, as people could see their idols taking up the challenge of cleaning India or going under the ice bucket.

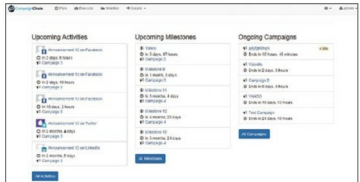

Figure 4: Managing all activities

Improper management is a glitch associated with a campaign and this arises mostly because of incomplete data or inconsistent information. The CampaignChain tool provides a tab named 'Execute' which shows a clear picture of the upcoming activities, the milestones to achieve and the ongoing activities. This helps in planning one's marketing campaign accordingly.

Any software is considered worthy if it is user friendly and takes good care of the customer. CampaignChain ranks high on both counts. It has a very user-friendly UI, backed by a group of professionals, who help in adapting CampaignChain to fit your marketing objectives and processes. Training is also provided with respect to the technical details of this tool. All you have to do is drop a mail to info@campaignchain.com.

If you wish to try your hand at it, download CampaignChain by visiting <http://www.campaignchain.com/try/>. The complete installation is provided in a manual at <http://doc.campaignchain.com/wp-content/doc/pdf/current/CampaignChainDocumentation.pdf>. But there are some prerequisites, such as your system must have PHP5.4 or a later version, Java 1.5 or a more current version and MySQL; PHP's `system()` function must work, etc. All these details can be found in the documentation.
