

Android and iOS that help making apps easier, React is a JavaScript based library, Flux is an application architecture which is used for building Web interfaces, Presto is a distributed SQL query engine, and HHVM is a virtual machine designed to execute PHP programs with a 5x increased throughput.

Other big players like Red Hat, Intel and Canonical are not behind.

Red Hat's community-driven Linux based operating systems, CentOS and Fedora, are very popular. Red Hat also has its own community driven version of OpenStack RDO and JBoss Developer, which is an application server that is open source.

Intel also plays a big role in the open source world. Its Yocto Project is an initiative in developing a shared development environment and tools for embedded developers.

Ubuntu, one of the world's most popular and widely used operating systems, is developed by Canonical, which has been developing a wide range of open source software like Juju – which is a service orchestration tool for the management and installation of cloud applications. MAAS (Metal-as-a-Service) is another innovative project that helps to manage physical servers and the cloud.

Believe me, this magazine will not be able to cover all the open source projects that are currently being developed out there!

India, being the world's largest outsourcing destination for software services and products, also has companies that are keen on OSS development. A good example is ESDS Software Solution (esds.co.in), where employees are constantly encouraged to innovate and contribute to the open source community in every way possible. Its products eNlight, eMagic and MtvScan are based on open source technologies.

eNlight is an intelligent and highly scalable cloud orchestration software that has OSS in its roots. It has the capability to manage virtual machines running on different hypervisors like Xen Server and HyperV. Unlike other cloud management software, eNlight intelligently scales the resources of a virtual machine, on the go, which reduces costs to a large extent. A feature of eNlight is

that you pay for what you consume, i.e., you have to pay for CPU, RAM and bandwidth only when the VM uses it! Since different businesses have different needs, customised cloud solutions like eNlight offer dynamic resource provisioning and scheduling.

eNlight can also be deployed as a private cloud solution, which supports a wide range of hypervisors like VMware, KVM, Xen Libvirt, apart from Xen Server and HyperV.

eMagic is another innovative, in-house developed data centre management software. It is a Web based system that is widely used for IT asset management, device deployment, and comprehensive server monitoring and network management in data centres. eMagic operates on a three-click concept—build, deploy and manage. Its auto discovery feature helps customers to discover all the devices in a network and deploy them. With the three-click concept, devices of multiple data centres across multiple geo-locations can be managed easily. Support for heterogeneous hypervisors for VM management makes it unique, along with wide traditional features like IP SLA monitoring, netflow, alerts, reports and application monitoring. A change management system, incident management system and problem management system are other enterprise features of eMagic.

MtvScan is an aggressive website security scanner that secures websites. It works on websites based on different frameworks like WordPress, Joomla, etc. It thoroughly scans for different vulnerabilities that might be present and notifies the developer accordingly. MtvScan provides automatic CMS scanning and agent based server side scanning. It proactively scans for malware, Trojans, security threats, infections and botnets. MtvScan also provides specialised defences against zero-day exploits, advisory security patches, etc.

OSS has changed the way we operate in the digital world. More and more people are being attracted by its collaborative culture. As in freedom of speech, we have inherited the freedom to use software. And this is going to go a long way!
