

Red Hat unveils a new mobile application development platform

Open source software solutions provider, Red Hat, has announced the release of the Red Hat Mobile Application Platform. This new platform will be incorporated with the FeedHenry mobile app technology. This collaborative initiative will provide an agile, 'full stack' mobile application development solution for businesses.

The new mobile application platform will help in delivering important and secure manageable integration with enterprise systems from a trusted provider of enterprise middleware, cloud and mobile solutions. Developers will be allowed to choose their development tools. With the help of a hosted build farm service, developers can deploy the same app to multiple platforms.

From the features' perspective, the application has advanced access like encryption and protected access to back-end systems. The platform can integrate with LDAP/Active Directory security. It includes a codeless development option, which helps in creating drag-and-drop forms. This further reduces the development time and effort. Offering mobile back-end-as-a-service technology based on Node.js, the mobile application platform makes it easy for the integration of mobile apps, managing data storage, scaling and messaging.

Cathal McGloin, VP, mobile platforms, Red Hat, said in an official release, "The Red Hat Mobile Application Platform is an agile development platform that facilitates collaborative application development through its team and role based model. Granular control of project access helps project managers divide project responsibilities among teams, whether they are UI/UX designers, front-end coders, back-end developers or systems administrators. The platform includes mobile application lifecycle management (ALM) and workflow tools, including integration with Git repositories."

For the future, Red Hat is planning to provide support for its mobile application platform through the OpenShift Enterprise public cloud.

Try out Manjaro 0.8.13 with the new Plasma, MATE or Cinnamon

Developed in Austria, France and Germany, Manjaro provides all the benefits of the Arch Linux operating system combined with a focus on user-friendliness and accessibility. The latest version has received a new update pack, the third for this development cycle, and the developers have upgraded a lot of the bundled packages, including LibreOffice and some of the supported desktop environments.

Manjaro uses Arch Linux as a base but it does not follow the same model that the latter does, i.e., it does not have a rolling release. Manjaro has intermediary versions and large updates that come with tons of new features. The previous update pack for Manjaro was made available just a short while ago.

According to the developers, "This time we released manjaro-tools 0.9.10 with several fixes. This introduces the manjaro-chroot automount feature. We fixed some legacy Nvidia drivers for Linux 318 (x86_64), updated KDE-Apps to 15.04.3, bumped LibreOffice to 4.4.4, added some newer GNOME packages, fixed Xorg-Server, released Cinnamon 2.6.12, Mate 1.10.0 and Plasma 5.5.3.2. We have Mesa now at 10.6.1, patched gcc5 5.1.0, updated kernels and a bunch of rebuilds. To round up our update, we fixed the Steam-Manjaro client, and pushed out some updates for Eric, Python and some needed repacks."

The Linux kernels that are supported this time are: Linux 310 3.10.83, Linux 312 3.12.44, Linux 313 3.13.11.22, Linux 314 3.14.47, Linux 316 3.16.7.14, Linux 318 3.18.17, Linux 319 3.19.8.2, Linux 40 4.0.7 and Linux 41 4.1.1.

If you already have the system installed and perform regular updates, then you don't really have to do anything extra.

Adobe announces release of its Technical Communication Suite for SMEs

Adobe has announced the 2015 release of the Adobe Technical Communication Suite. The US based company has introduced the next

level of its complete single-source authoring and multi-device publishing toolkit for technical writers. The new version of Adobe Technical

Communication Suite will help SMEs and casual authors in the creation of valid XML without worrying about the complexities of XML programming.
