

Adobe is now offering a streamlined authoring and publishing solution that is simple enough for the occasional contributor or subject matter expert (SME). Authors can get the best experience of easy, form-like authoring with the FrameMaker user interface of Adobe FrameMaker XML Author.

Adobe has expanded its content adoption, which now delivers across tablets, smartphones, e-readers and desktops, and can be printed through single-click publishing. Output formats include responsive HTML5, e-book and native mobile apps.

Gello: An open source Chromium browser for Android by CyanogenMod

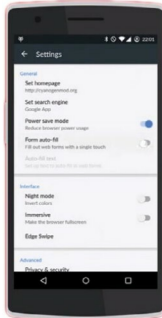

CyanogenMod is all set to launch an open source Chromium browser for Android. Named Gello, this browser is packed with features like 'Save for offline reading', night and immersive modes, etc. Apparently, Chromium happens to be an open source version of the Chrome browser. Though there has been no announcement regarding the release of Gello for the general public, the firm has launched a teaser video that has grabbed eyeballs while offering a glimpse of its new project. However, Gello will reportedly come with an open source licence so that tech buffs can experiment and contribute to the project.

While Gello may seem similar to the Chrome browser, CyanogenMod has added some interesting features such as the ability to relocate and rename downloads, cycle through open tabs using an edge swipe gesture and site-by-site privacy settings.

Gello will reportedly not be available on 'low end devices or devices with small system partitions.' Hence, you might not be able to use it if you have an entry-level handset.

OwnCloud 8.1 released with improved end user and admin experience

OwnCloud Server has significant improvements for users, administrators and developers in the latest 8.1 release. This release contains significant under-the-hood improvements, increasing scalability and performance of syncing and file operations while making ownCloud a better platform for developers to build upon. It is now easier to keep ownCloud updated with the channel of your choice via the built-in Updater app and the package repositories. Personal settings, users and admins will also notice that documentation links have been integrated, making it easier and quicker to

And here comes Firefox 39

The latest release of one of the most popular Web browsers will enhance your Internet browsing experience. After a delay of a couple of days, Firefox 39 has finally been released. With this release, OS X and Linux versions of Firefox are playing catch-up with the Windows version —finally receiving support for SafeBrowsing, which helps users identify if a download is malware. Another feature, just for OS X users this time, is the inclusion of Project Silk. As the name suggests, this ensures smoother animations and scrolling on the OS X version of Firefox. You can read more about the technical details at Mozilla Hacks.

In the new release, we have Hello becoming more social. Hello is the new chat client using WebRTC that is built into Firefox. In this release, Hello will let you share links or Hello invitations to your social networks —you now won't have to copy, navigate tabs and paste the URL into your social streams. You can add social networks from the 'Services for Firefox' page.

Other new features include: support for the 'switch' role in ARIA 1.1 and support for the new Unicode 8.0 skin tone Emoji. In terms of security, this release has stopped support for the insecure SSLv3 for network communications. RC4 has also been disabled apart from when connecting to temporarily whitelisted hosts.

Along with a few additions to the developer tools, users can expect better HTML5 support and a bunch of fixes which improve performance and remove regressions.

Many of the security issues in the earlier release have also been fixed in Firefox 39.
