

Ubuntu 15.10 adopts systemd

Ubuntu 15.10 is now under development state, and developers are upgrading packages to make it an improved and stable release. One of those packages is the systemd component, which has been recently made default in Ubuntu.

systemd is a system and service manager for Linux. It provides aggressive parallelisation capabilities, uses socket and D-Bus activation for starting services, offers on-demand starting of daemons, keeps track of processes using Linux control groups, supports snapshotting and restoring of the system state, maintains mount and automount points, and implements an elaborate transactional dependency-based service control logic.

Ubuntu announced that it was adopting systemd shortly after the Debian Project decided to make the switch, but the transition for Canonical's OS has been much quieter and with a lot less drama. No one threatened to fork Ubuntu without systemd, and no one really cared, which is weird since Ubuntu is the most used Linux operating system.

"systemd 222 landed in Debian unstable yesterday, and just made it through britney's CI and landed in Ubuntu wily. The upstream semaphore CI, the 'daily trunk builds' with complete autopkgtest coverage, and pre-announcing the impending release really helped immensely! Packaging 221 and 222 was child's play compared to the earlier versions," said Martin Pitt on Google+.

"We've been awfully quiet lately, which usually means something is brewing below the surface. In the past few months, we've been working feverishly on our next generation of Kali Linux, and we're really happy with how it's looking so far. There're a lot of new features and interesting new aspects to this updated version; however, we'll keep our mouths shut until we're done with the release," wrote the developer team in a short blog post.

Red Hat launches Certified Cloud and Service Provider program

Red Hat recently announced the global launch of the Red Hat Certified

Cloud and Service Provider program. Replacing Red Hat's existing Certified Cloud Provider program, the Certified Cloud and Service Provider program expands Red Hat's cloud ecosystem to better support distributors, and manage service providers and other partners that

are heavily involved in all aspects of hybrid cloud build-out, and not just multi-tenant public clouds.

This recently launched program brings additional flexibility, choice and scalability to partners that are building the open hybrid cloud.

"Much like enterprise IT itself, the world of cloud computing is constantly evolving, especially with the growing promise of hybrid cloud approaches and Linux container based architectures. The Red Hat Certified Cloud and Service Provider program is designed to encompass nearly all service provider models, spanning the public cloud to onsite managed services, offering our customers a secure, stable and trusted partner ecosystem upon which to build their next-generation IT projects using Red Hat solutions," said Michael Ferris, senior director, business architecture, Red Hat.
