

```
-o --out <dir>          output the compiled html to <dir>.
```

This avoids mixing of Jade files with HTML files. You can have a whole directory watched.

```
-w --watch              watch files for changes and
                        automatically re-render.
```

Table 2

p Delhi is a fine city.	 <Delhi> is a fine city.</Delhi>
p. Delhi is a fine city.	 Delhi is a fine city.
h8 This is an invalid header.	<h8>This is an invalid header.</h8>

Jade tips for newbies

Jade is space and tab sensitive. Configure your editor to have either spaces or tabs, but they should not be mixed in the same file. For example, if you copy code from a browser to an editor, it is possible that you have a mix of tabs and spaces in your file. The Jade file interpreter will fail with errors. This is the most common mistake made by beginners.

Every first string in a Jade file is converted to an HTML tag. In the first of the three examples given in Table 2 above, a custom tag `<Delhi>` is created. This tag is not created in the second example because there is a `.` (dot) after `p` (paragraph tag). Also remember that Jade does not recognise

HTML tags. A typo in an HTML tag will create a new tag, as shown in the third example.

Remember that no file should start with an indent, and the first line's first character should not be space.

You can convert your existing HTML files to Jade using the online tool. This helps you get familiar with Jade faster.

Other features

This article covers just a basic introduction to Jade. There are advanced features like inheritance, mixins, include, etc. You need to be familiar with the inheritance concept to understand Jade in Node Express auto generated files. Look for the online references for these features.
