

Table 2: A comparison with other SDKs

|                              | MoSync                        | Apache Cordova                                               | Open-MEAP                        | iOS SDK            | IBM Worklight                  |
|------------------------------|-------------------------------|--------------------------------------------------------------|----------------------------------|--------------------|--------------------------------|
| Software License             | GPLv2/Commercial              | Apache License v2                                            | GNU LGPL version 3               | Commercial License | IPLA                           |
| Supported Operating Systems  | Windows and Mac OS            | Windows, Mac and Linux (CLI)                                 | Windows 7 or higher and Mac OS X | Mac OS X           | Windows and Mac OS             |
| Supported Mobile Platforms   | Android, Windows, iOS, Moblin | Firefox, Android, BlackBerry, iOS, Tizen, Ubuntu and Windows | Android, iOS and BlackBerry      | iOS                | iOS, Windows and Android       |
| Programming Language Used    | C, C++ or HTML5               | HTML5, CSS and JavaScript                                    | HTML5, CSS3 and JavaScript       | Objective-C        | HTML5, CSS and JavaScript      |
| IDE Used                     | Eclipse based                 | Eclipse based                                                | Independent IDE                  | Xcode              | Eclipse based                  |
| Building Native Applications | Yes                           | Yes                                                          | Yes                              | Yes                | Native and Hybrid Applications |

so that it is highlighted.

- Now, either press **Ctrl+F11** or the **Run** button on the toolbar to build and run your application.
- The MoRE emulator, the default emulator for MoSync SDK, can be chosen when prompted. Table 2 compares MoSync with other SDKs.

## Updates

### What's new in MoSync SDK 3.3

- C++ camera API:** The new version comes with a C++ camera API, which enables the applications to make use of the device's camera.
- MoGraph:** MoGraph 3D Library can be used to create animated diagrams, 3D charts, display real-time data, visualise data and create artistic applications and animations.
- Screen transitions:** The release has added native user interface screen transitions to give the right look

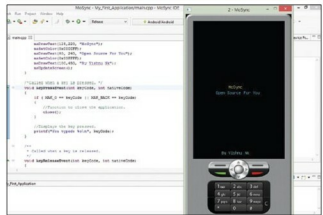

Figure 7: Application running on MoRE emulator

and feel.

- Custom Picker widget:** This enables you to implement a drop-down list with custom elements.

### What's new in MoSync Reload 1.1

- Command line tool for Reload:** The command line tool can be used to control the Reload server, integrate Reload with existing development tools and create scripts to perform Reload tasks.
- Updated Reload client, development UI and Reload**

**server:** An updated Reload client includes automatic server discovery, support for saving projects locally, etc. The new development UI has also enabled a lot of new features including a new workbench and a 'highlight hint help system'.

### MoSync SDK 3.2 announces on-device JavaScript debugging

The MoSync SDK 3.2 release comes with a JavaScript debugger, extended libraries and APIs supporting the Android 4.x platform. The new debugger ensures the robustness of the code. The existing code can be also used to develop applications for the Android 4.x platform, which ensures conformity with the most used Android version. **END**
