

Note: The sample code for developing a to-do project is hosted on GitHub [ZF2TodoOsfy](https://github.com/savankoradia/ZF2TodoOsfy) - <https://github.com/savankoradia/ZF2TodoOsfy> and will be updated with each tutorial. The latest development is a deployed user interface on <http://todo.savankoradia.com/> and admin interface on <http://todo-admin.savankoradia.com/>. All developers and readers are invited to send their valuable notes and suggestions to my email ID.

If you have shared hosting and there is no option to create a virtual host on the existing path, then you can change the route type as below. You can access the admin interface using <http://todo-local.com/admin url>.

```
'router' => array(
    'routes' => array(
        'admin' => array(
            'type' => 'Segment',
            'options' => array(
                'route' => '/admin',
            ),
            'defaults' => array(
                'controller' =>
                    'Application\Controller\Auth',
                'action' => 'index',
            ),
        ),
    ),
)
```

You can view the entire code at `module/Admin/config/module.config.php`.

For this, you need to create a new virtual host `admin.todo-local.com` on your server, which will point to the same directory that is pointed by `todo-local.com`. So, at last, both interfaces will look as shown in the screenshots in Figures 1, 2 and 3.

Common misconceptions about routers

Many developers have one common misconception about routing. They follow the rule of `http://siteurl.com/<module>`

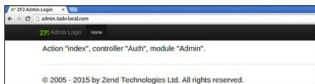

Figure 1: Admin interface

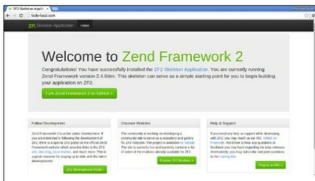

Figure 2: User interface

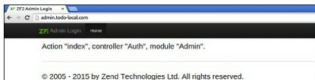

Figure 3: Access the admin interface from the main host, for shared hosting

`</controller>``</action>`. But we can specify any route URL that we need. For example, if the login action is in the `Auth` controller of the admin module, then the misconceived URL will be `http://todo-local.com/admin/auth/index`. But we can make a route like `http://todo-local.com/admin/login`, as this can be a more user-friendly URL. **END**
