impairment or blindness. Screen Reader allow users to identify the option that they have touched, and decide whether they want to activate the option that was touched. Similarly, there are other components such as sound feedback, haptic feedback, etc. If the app is perceivable, operable and

understandable, TalkBack makes it easy for people to use it, thus making the app robust (Figure 2).

2. **Switch Access:** This is used to associate certain buttons (such as the power button) with specific operations that help the user navigate across multiple screens,
3. **Captions:** Captions for videos are displayed when this option is enabled. The user may decide how the caption should be displayed—whether it should be displayed in yellow on a black background, whether the text size should be large or not, etc. This option makes the app more perceivable to the user (Figure 4).
4. **Magnification gestures:** If this option is enabled, users can not only zoom in and out using the usual pinch gesture, but while the page is zoomed in, they can also pan across the screen with the help of two or more fingers. If the screen is tapped thrice, the area under the user's finger will be magnified and the screen will return to the previous state when the finger is lifted. This makes an app not only perceivable, but also operable (Figure 5).
5. **Large text:** If this option is selected, the size of the text on the phone across all the screens
