// Inventory "form"  
<?php  
  
$con=mysql_connect("localhost","root","qwerty");
```

```
mysql_select_db("lms",$con);
$id=$_GET["id"];
$query=mysql_query("SELECT * FROM
inventory WHERE id=".$id);
$row=mysql_fetch_row($query);
mysql_close($con);
echo"<tr><td>
</td><td>.$row[0].</td></tr>";
echo"<tr><td>Product name
</td><td>.$row[1].</td></tr>";
echo"<tr><td>Product name alt</
td><td>.$row[2].</td></tr>";
echo"<tr><td>CAS number
</td><td>.$row[3].</td></tr>";
...
echo"<tr><td>Signature
</td><td>.$row[19].</td></tr>";
echo"<tr><td>Notes
</td><td>.$row[20].</td></tr>";
?>
```

The database presented here is very basic and there is much scope for improvement.

A system based on 'something-SQL' and PHP has high flexibility and is adaptable to specific needs. Considering the same ISO standards about quality assurance, different contract analysis laboratories can have quality policies very different from each other. So the choice of software and how to use it is not a problem. It's always possible to find a way that satisfies both the technical standards and the company's needs. You can visit http://en.wikipedia.org/wiki/List_of_LIMS_software_packages for some interesting examples of much more complex software. In my opinion, for the kind of applications described here, commercial software do not have any significant advantages.  **END**
