

A Simple Screen Recorder for Linux

Making screen recordings has never been so easy. The complications of screen recording in Linux have been banished by the Simple Screen Recorder. This versatile tool enables full screen recording or recording a fixed rectangle or just following the cursor.

Screen recording is most useful when creating a 'How to...' tutorial. The screens are captured and converted into a video that can be posted on video-sharing sites. Screen recording software is mostly proprietary and it's difficult to produce good quality videos with free software.

Recording a screencast in Linux OS is a tedious task, as either the video/audio malfunctions or there may not be support. A solution for both these problems is to use Simple Screen Recorder (SSR).

SSR is a tool that records and processes screencast video in no time. When using popular proprietary software, if you record the screen for an hour, the subsequent processing may take another 20 to 50 minutes, depending on the quality. But SSR does on-the-fly recording and processing within seconds. The same one hour video can be processed in a few seconds.

Alternative software

There is an alternative available within VLC Media Player, which has some shortcomings compared to SSR. The latter has a straightforward interface and is incomparable to other software in the market.

- VLC is slower than SSR.
- VLC uses more RAM, whereas SSR has a small memory footprint.

- SSR is multi-threaded, optimising all the cores of the processor. The more cores used, the faster the operation.
- In SSR, live streaming is possible, though this is still in the experimental stage.
- SSR supports many different codecs like MKV, WebM, MP4, etc.
- SSR can record a 32-bit Open GL application within a 64-bit OS. Shortly, it will even be able to record a video game.

Installation on various distributions

Distros like Ubuntu, Fedora, Slackware, Linux Mint, etc, all support SSR, though they have to be tweaked slightly during installation.

Ubuntu and Linux Mint

To install SSR, enter the following commands:

```
#add the repository to the PPA of ubuntu
$] sudo add-apt-repository ppa:maarten-baert/
simplescreenrecorder
#update the repository
$] sudo apt-get update
$] sudo apt-get install simplescreenrecorder
```
