

you focus solely on writing. All editing tools can appear with just one click." The distraction-free writing mode also clears away the additional navigation buttons. WordPress has introduced its Twenty Fifteen theme with this update, which features Google Noto fonts. Noto supports up to 44 languages. WordPress 4.1 has an advanced plug-in installer, which gives suggestions based on administrator recommendations. Developers have also focused on the security aspects in this update. The update fixes the misconstructed script in PHP code.

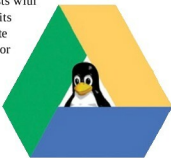

Users can now log out of their WordPress site from the user profile section also. This is in order to address the very common mistake users make of forgetting to log out from their WordPress site.

Google Drive now supports the ODF file format

Google has surprised open source enthusiasts with a gift. The company has finally announced its support for the ODF format in its Drive suite of application services. This is great news for open source enthusiasts who had trouble sharing ODF format files with their friends using the Microsoft Office suite.

Earlier, open source users had to export the document in .doc or .docx to share the files with other users. With ODF file support, Google is tapping the category of users who might have been contemplating abandoning Google Drive services due to interoperability issues.

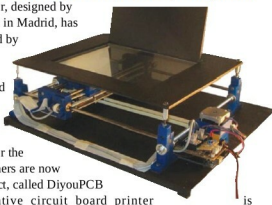

When the British government made ODF the default file format for government-related work, Google service users had to ditch it and get an ODF-supported office suite. Other European countries are also adopting open source pretty rapidly. With such a situation, Google had to start offering support for the ODF file format with Google Drive. In short, it was the UK government that created the demand for ODF support.

DiyoubPCB, a new open source, do-it-yourself, PCB printer

An open source PCB printer, designed by two Spanish brothers based in Madrid, has been released. It is powered by an Atmel-based Arduino Uno (ATmega328) development board. Dubbed as DiyoubPCB, it has been inspired by the RepRap 3D printer. The printer has been in development for the last few years and the brothers are now focused on their next project, called DiyoubPCB TwinTeeth. This innovative circuit board printer expected to revolutionise the working strategy of developers while they create new projects and devices.

The brothers have been quite passionate about design, electronics, robotics, mechatronics and software development. That's why they love to design open source, low-cost robotic tools which can help people

New Trojan detected in Linux systems with rootkit installation

A new Trojan has been detected. It infects Linux systems and is supposed to be building an arsenal of devices which will be used for DDoS or denial-of-service attacks. This threat has been named XOR.DDoS. Based on the Linux environment, the installation procedure of this Trojan keeps varying and it also runs a rootkit so that detection can be avoided. In Windows systems, too, a similar Trojan has been spotted. This news has been shared by Peter Kalnai, the malware analyst at Avast, and he said that the Trojan targets unexplored zones in Linux systems. According to Kalnai, it's tough to set a rootkit component in a Linux environment as it needs compliance with the operating systems on the victims' systems.

XOR.DDoS is launched on those systems that still use default log-ins across various network IDs. If the attack is successful, then the Trojan starts determining whether its compatible with the kernel or not. Then it installs its rootkit to avoid detection. The rootkit helps the Trojan in concealing its files, which merely hints that some kind of attack has taken place yet victims stay unaware about the compromise. According to Kalnai, this rootkit angle of the Trojan was first discovered in October 2014. The Trojan and all its variants can infect 32-bit and 64-bit Linux Web servers and desktops, as well as the ARM architecture. This indicates that routers, Internet of Things devices and ARM servers could also be affected. It's not that several infections have taken place but this Trojan has the potential to impact enterprises as well as individuals—the latter being more vulnerable to attacks as enterprises follow stricter security measures. A small group is suspected to be behind the attacks as the Trojan is not present in forums.
