

KDE Frameworks 5.6.0 released with tons of improvements

A new update, KDE Frameworks 5.6.0, has been released by the KDE community. Tons of new improvements have been made to the framework, making it a very interesting release. Three separate categories have been announced for the KDE software compilation section – KDE Frameworks, KDE Plasma and KDE Applications. While KDE Frameworks comprise the libraries and core ingredients of the project, the desktop is KDE Plasma and the regular apps have been included in the KDE Applications section.

As the development cycle is looking to improve efficiency, the categories have been divided for a more streamlined process. Now developers don't need to wait for when all the project components are ready to get deployed, since version numbers will also be different for KDE Frameworks, KDE Plasma and KDE Applications. KDE Frameworks is not a very well-known term, with most users unaware of the fact that it's one of the most important parts of the KDE ecosystem.

The official announcement says, "KDE today announces the release of KDE Frameworks 5.6.0. KDE Frameworks are 60 add-on libraries to Qt, which provide a wide variety of commonly needed functionality in mature, peer reviewed and well tested libraries with friendly licensing terms. This release is part of a series of planned monthly releases making improvements available to developers in a quick and predictable manner." The improvements in the new release include the addition of the ActivityInfo QML object, a KCoreAddons upgrade, upgrading notifications, bug-fixes in the KDE Plasma network and some others too. This new release is a sophisticated one, and users need to have adequate knowledge about KDE Frameworks before compilation.

worldwide. Their aim is to create the first generation of robots that can be built in the garages of common people. DIYware, that the brothers are working on, is nothing but 'do-it-yourself-ware'—hardware that you can create on your own.

A Linux-based gadget that charges phones wirelessly up to 4.57 metres

WattUp is a Linux-based device made by Energous, and it can charge mobile devices wirelessly up to 4.57-metres (15-feet) by using Wi-Fi beam-forming

technology. Launched at CES 2015 in Las Vegas, WattUp acts more like a Wi-Fi router and uses the 5.7-5.8GHz frequency bands, just like Wi-Fi. It also uses the 2.4GHz Bluetooth Low Energy (BLE) communication channel and can charge more than one device simultaneously, even

when the devices are being used. During peak hours, the device gives more priority to handsets than to TV remotes and cameras.

The accompanying apps can be accessed from remote locations too, and they can be used to tweak the priorities. The receiver chips in WattUp convert the radio waves into DC power and if there is no authorised device within the range, the transmitter in the device saves power. Compatible devices include smartphones, tablets, e-readers, smartwatches, fitness trackers, remotes, home automation sensors, lights and battery-powered toys. Energous was also a part of the 2015 CES Innovation Awards Honoree list in categories like Smart Home, Portable Power and Embedded Technologies. The devices will support 'closed network' environments as well as open networks.

Mozilla Firefox 35 released

Mozilla has released Firefox 35.0 Final for desktop versions. In this version, the Firefox Hello real-time communication client tool has a new feature—a search user interface has been integrated along with improved preferences. If you are an Android user, then you can use the geo-location tools too.

Those using the new chat model will be able to organise conversations and contacts in different groups to keep track of the chats.

Firefox Hello poses a huge threat to Skype and was launched with Firefox 34. The Firefox Marketplace has also been made more accessible in this latest version, as it has been placed on the Tools menu and an optional toolbar button has also been added. Firefox 35 is also expected to offer a better response time, and encrypted connections have made it more secure through the HTTP Public Key Pinning Extension.

Firefox 35 has also added support for new HTML5 features—it will enable CSS filters by default and will also implement the Resource Timing API. The update has come with lots of bug-fixes.
