

Use Ubuntu to Customise Your Linux Distribution

This article guides readers on customising a Linux distribution using the Ubuntu Customization Kit. Readers who like getting their hands dirty playing around with software will enjoy it.

I have installed Linux Mint 17.1 in my system and will show you how to build your custom Linux. You can install the Ubuntu Customization Kit (UCK) from the software manager or from the terminal.

Go to *Menu -> Software Manager*. Type *UCK* in the search bar and install it. Refer to Figure 1.

If you want to install it from the terminal, type the following command:

```
$ sudo apt-get install uck
```

You need a base ISO image that you can customise. You can download an Ubuntu or Linux Mint ISO image from the website.

Creating a customised ISO

You can launch the Ubuntu Customization Kit from the dashboard or from the terminal.

Go to *Menu* -> *Type UCK* and press *Enter*. From the terminal, type the following command:

\$ uck-gui

You will now see a welcome screen (Figure 2).

After you press 'OK', another screen will ask for your language preference. I chose English. The next screen will ask you to choose the language at the time of booting up. I, again, chose English.

You will then be asked to choose the desktop environment for the customised ISO. Here, I chose Unity and GNOME. You can decide which desktop environment you want as shown in Figure 3.

The next screen will prompt you to enter the name for your customised ISO. I entered *nabinlinuxmint* and pressed 'OK'. You must then choose the base ISO, when prompted. Since I have my base ISO in 'Downloads', I went to the 'Downloads' folder, selected the base ISO and pressed 'OK'.

The next screen will ask you whether you would like to customise Linux. Select 'Yes' and press 'OK'. Next, you will be asked if you want the Windows option. I selected 'No'
