but if you select 'Yes', you can run it under a Windows environment like WUBI.

The next screen will ask you whether to generate a hybrid image. I selected 'Yes' and pressed 'OK'. You will then get a message stating, 'Now your ISO is ready to build'. Your live CD will be created and will be in `/home/nabin/tmp/remaster-new-files/livecd.iso`.

Now, after you press 'OK', you will be redirected to your terminal. Here, you have to enter your root password, after which it will start unpacking the ISO that you have chosen. Once the process is over, a screen will prompt you for customisation. Here, you can select 'Run Console Application' and press 'OK'.

Once you press 'OK', a new terminal window will open. You can now add any number of software that you want. Just use the command `apt-get install (name of software)`.

For example, I installed JDK by issuing the following command:

```
apt-get install default-jdk
```

To install the SUMO simulator, the command is:

```
apt-get install sumo
```

In this way, you can install any number of software that you want. Once you have finished installing the software, type 'Exit' in the terminal and hit 'Enter'. A screen will pop up and ask you whether you want to run the console application or continue building. If you want to install some other software, select 'Run console application' and press 'OK', or you can select 'Continue building' and press 'OK'.

After this, a background process will run in the terminal. Here, it will re-build your ISO with all the software and packages that you have installed. Once the building is over, a screen will pop up saying 'Build Success'. After you press 'OK' you will return to your normal terminal.

You can now go to `/home/nabin/tmp/remaster-new-files/livedvd.iso` (in my case) and use the fully loaded ISO. **END**
