

Figure 1: Laravel PHP Framework

Figure 2: Phalcon PHP Framework

reduces development time immeasurably.

Yii is more than just a framework as it encapsulates a rich set of features:

- Role-based access control
- It is object-oriented
- Form validation support
- Scaffolding
- Caching

CodeIgniter

CodeIgniter is an elegant, small and clean PHP framework empowered with great documentation. It comes with an extremely small footprint, and is extendable via dynamically loaded additional libraries.

CodeIgniter has many advantages that may excite a newbie:

- Almost zero configuration
- There's no need to learn templating
- Elegant design
- Great performance
- And, most importantly, a very small footprint

CakePHP

CakePHP is a traditional MVC framework and has been in the market for quite some time now. It's very stable and has great support from the open source community. Being a leader, CakePHP provides a handsome set of modules to help developers write less code to get the task done.

The compelling features of CakePHP are:

- No additional XML or YAML file configuration

- Database access
- Input validation
- CSRF protection
- Form tampering protection
- SQL injection prevention
- Prevention from cross-site scripting

Zend framework

The Zend framework comes with enterprise support. It has been widely accepted by developers as it includes security in its wiring. It may initially appear to be cumbersome but it's simple, once learned.

The principal benefits that Zend brings are:

- Flexible architecture
- Tried and tested by lots of organisations
- It's a collection of classes, hence can be trimmed down to only the required libraries

Kohana

Kohana has been developed with real world usage in mind. It is an object-oriented PHP framework offering features not provided by any of its competitors. It provides a handsome package of features which will overwhelm developers.

It has remarkable built-in support for:

- Code profiling
- Debugging tools
- Translation tools

These features definitely save a lot of time in real world scenarios.

Fuel

Fuel is a community driven PHP framework. It is the consolidated output based on the learnings from other frameworks. Fuel is completely based on HMVC architecture.

Fuel uses ViewModels – to provide support to add an optional layer between Controller and View. It requires PHP 5.3+ to provide high quality features.

Symfony

Symfony maintains PHP originality by using standard naming conventions and provides modules that can make complex tasks a cakewalk. Using Symfony guarantees stability, as it is built on standard conventions.

Laravel uses the Symfony framework, which provides robust support and makes development more easy and handy.

Aura

Aura is a PHP 5.4+ framework that can be used in any database, alone or in concert with each other, or in a full-stack framework of its own.

Aura inherits the following advantages from PHP 5.4:

- Formal name spaces
- Anonymous functions
- Late static binding
