

DVD OF THE MONTH

Fedora 21: The distro for your server, laptop, desktop and the cloud

Fedora 21: This is a free operating system for anyone to use, modify and distribute. The big change in the latest release is that it now comes in three flavours—for the cloud, server and workstation. All the flavours are based on the same common base but have packages relevant to the use case.

Fedora Workstation: This is a reliable, user-friendly and powerful operating system for your laptop or desktop computer. It supports a wide range of environments for developers, hobbyists and students. It comes with a sleek user interface and has built-in Docker support. The GNOME Boxes and other virt tools help you get virtual machines up and running quickly to test your code on multiple platforms.

Fedora Server: This is a powerful and flexible operating system. The latest release of the OS puts you in control of all your infrastructure and services. You can manage a wide variety of system parameters with OpenLMI. It also comes with an advanced identity management tool called FreeIPA.

Fedora Cloud: This is a minimal, fast and flexible system. The Fedora Cloud Base image is smaller, so you can deploy it faster and then use the range of services and tools in Fedora to customise your cloud so that it's right for you. Deploy and run Fedora Cloud in public or private cloud infrastructure, using the industry standard tools cloud-init/ and OpenStack Heat.

Scientific Linux 7.0: Here is a free and open source operating system based on Red Hat Enterprise Linux. The OS has been co-developed by Fermi National Accelerator Laboratory and the European Organization for Nuclear Research (CERN).
