

Comparison of IDEs

	Eclipse	JCreator	JBuilder
Developers	IBM	Xinix Software	CodeGear
Written in	Java	C++	Java
Stable release	4.4.1 (Luna) / 26 September 2014;	5.00.017 (August 2012)	2008 R2 / April 23, 2009
Operating system	Java, Linux, Windows, Mac OS	Windows	Java, Linux, Windows, Mac OS
Licence	EPL	Proprietary	Proprietary
Type	Programming tool, IDE	Java IDE	IDE
GUI builder	Yes	No	Yes
Website	http://www.eclipse.org/	http://jcreator.com/	http://www.embarcadero.com/products/builder

Creating a Java Web project

Go to **File** → **New** → **Web** → **Dynamic Web Project**. Give the project name *FirstWebProject* and click on **Next**. Select the source folder on build path, and then select the default output folder as 'Keep Context Root' and the content directory as 'FirstWebProject' and 'WebContent', respectively. Keep the 'Generate web.xml deployment descriptor' checkbox selected. It will create a deployment descriptor:

```
<?xml version="1.0" encoding="UTF-8"?>
<web-app xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xmlns="http://java.sun.com/xml/ns/javaee"
xmlns:web="http://java.sun.com/xml/ns/javaee/web-app_2_5.xsd"
xsi:schemaLocation="http://java.sun.com/xml/ns/javaee http://java.sun.com/xml/ns/javaee/web-app_2_5.xsd" id="WebApp_ID"
version="2.5">
  <display-name>FirstWebProject</display-name>
  <welcome-file-list>
    <welcome-file>index.html</welcome-file>
    <welcome-file>index.htm</welcome-file>
    <welcome-file>index.jsp</welcome-file>
    <welcome-file>default.html</welcome-file>
    <welcome-file>default.htm</welcome-file>
    <welcome-file>default.jsp</welcome-file>
  </welcome-file-list>
</web-app>
```

Create an HTML file in the 'WebContent' directory:

```
<!DOCTYPE html PUBLIC "-//W3C//DTD HTML 4.01 Transitional//
EN" "http://www.w3.org/TR/html4/loose.dtd">
<html>
<head>
<meta http-equiv="Content-Type" content="text/html;
charset=ISO-8859-1">
<title>Insert title here</title>
</head>
<body>
<h1>First Java Project in Eclipse</h1>
</body>
</html>
```

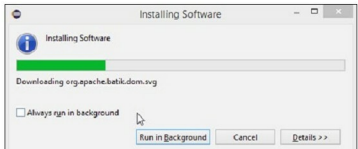

Figure 7: Installing software

To export a Java Web project, right click on 'FirstWebProject', and go to **Export** → **WAR File**.

Deploying a WAR File in Tomcat using Eclipse

Select the Web project, and then select the destination folder.

You can select the target runtime if you need to optimise for a specific server time.

If you need to keep source files in the WAR files, then check the 'Export source files' checkbox.

Click on **Finish**. Now verify the *webapps* folder of the destination Tomcat server; it will contain *WAR File* of *FirstWebProject*.

Update Eclipse.

Go to **Help** → **Check for updates**.
