GNOME 3.17.1 has been officially released

The GNOME development team earlier started work on the next major version of the acclaimed desktop environment, GNOME 3.18, and they've just released the first snapshot, GNOME 3.17.1.

GNOME 3.17.1 is now available for download and testing, and includes various updated core components and GNOME applications, including GNOME Shell, GTK+, Brasero, Cheese, Mutter, Evince, Evolution, Gedit, Weather, Polari, etc.

"To compile GNOME 3.17.1, you can use the jhbuild modulesets, which utilise the exact tarball versions from the official release," an official statement from the development team said.

The next development version of GNOME 3.18 is GNOME 3.17.2, which was scheduled to arrive in the end of May. Then, GNOME 3.17.3 ships on June 24, GNOME 3.17.4 on July 22, GNOME 3.18 beta 1 on August 19, GNOME 3.18 beta 2 on September 3, and the GNOME 3.18 release candidate (RC) version on September 16.

The final release of GNOME 3.18 will arrive on September 23, 2015. You can download the GNOME 3.17.1 sources from Softpedia, but if you are not able to test this early development release of the upcoming GNOME 3.18 desktop environment, it is recommended that you wait a little longer for a GNOME based Linux distribution to include these packages.

Latest OpenBSD 5.7 'Source Fish' is available for download

OpenBSD (Berkeley Software Distribution) is a free, multi-platform BSD based UNIX-like operating system that has been upgraded to version 5.7, and is now available for download.

OpenBSD is one of the few operating systems out there that manages to keep a strict release schedule, and the developers push a new version out the door twice a year. The previous OpenBSD release was made back in November 2014, and the new version has arrived just on time.

The OpenBSD project produces a free, multi-platform 4.BSD-based UNIX-like operating system. According to the website: "Their efforts emphasise portability, standardisation, correctness, proactive security and integrated cryptography. As an example of the effect OpenBSD has, the popular OpenSSH software comes from OpenBSD."

According to the changelog, the hardware support has been improved (including for USB 3.0 controllers), some generic network stack improvements have been implemented, the installer has been refined, a number of security fixes have been added, OpenSMTPD has been upgraded to version 5.4.4, OpenSSH 6.8 is now available by default, and numerous LibreSSL refinements have been implemented as well.

Red Hat expands the benefits for JBoss EAP subscribers

Red Hat, the world's leading provider of open source solutions, has announced Red Hat JBoss Enterprise Application Platform (JBoss EAP) 6.4, and introduced expanded benefits for JBoss EAP subscribers deploying their Java applications in hybrid cloud environments.

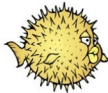

Enterprises are under pressure to deliver new applications fast; however, many

Massive Ubuntu Touch update coming to phones and tablets

The session titled 'Phone Roadmap' conducted in May 2015 was one of the most popular and constructive for Ubuntu Touch developers. They reviewed the product roadmap for the phone, primarily the feature set that's coming up in the next three months or so. The developers talked about the upcoming features implemented in the OTA 4 update that will be released by the end of May and will be based on Ubuntu 15.04 (Vivid Vervet).

There is a lot of new good stuff coming to Ubuntu for phones, especially for BQ Aquaris E4.5 users, prior to the entire transition to Snaps, which will come later this year. First of all, multimedia support will be greatly enhanced, with playback visibility in the indicator, playback controls in the sound indicator, and support for .M3U files. Second, there will finally be support for playing videos under the lock screen (background playback), hotspot support, USB tethering support, better Bluetooth support, proper 3G data setup, NFC support, a private browsing mode, bookmark folders, copy and paste across fields, support for adding Web apps to the Home screen, better app startup performance, and new keyboard layouts for different languages.

Other features that will come to an Ubuntu phone near you this summer are spatial recognition, improved input method support, Asian language improvements, filters and effects to the camera app, Qt 5.5 support, shell rotation support, Scope customisation, Scope filters, WPA Enterprise support, in-app purchases support, better scrolling performance, as well as a revamped thumbnailer.
